Bourns® Multifuse® Product Line Adds New Electron Beam Facility

Bourns® Multifuse® PPTC Product Line is announcing the completion of its own electron beam accelerator facility. This process has been traditionally outsourced, but now Bourns will add its own facility to our supply chain.

Bourns will consolidate polymer extrusion and ebeaming in this facility in Xiamen, China. Opening the new facility will help reduce lead times, as well as give greater control over product quality and costs. It is expected that this new capability will aid in the development of next generation polymer PTCs.

The addition of this new facility will not affect the performance, fit, form, function or agency approval of Multifuse® PPTC products.

Please contact your [local Bourns or Bourns AG representative](#) with any questions or refer to our website at www.bourns.com.

The new facility will be in production from August 1, 2012.
