

The following document contains information on Cypress products. The document has the series name, product name, and ordering part numbering with the prefix “MB”. However, Cypress will offer these products to new and existing customers with the series name, product name, and ordering part number with the prefix “CY”.

How to Check the Ordering Part Number

1. Go to www.cypress.com/pcn.
2. Enter the keyword (for example, ordering part number) in the **SEARCH PCNS** field and click **Apply**.
3. Click the corresponding title from the search results.
4. Download the Affected Parts List file, which has details of all changes

About Cypress

Cypress is the leader in advanced embedded system solutions for the world's most innovative automotive, industrial, smart home appliances, consumer electronics and medical products. Cypress' microcontrollers, analog ICs, wireless and USB-based connectivity solutions and reliable, high-performance memories help engineers design differentiated products and get them to market first. Cypress is committed to providing customers with the best support and development resources on the planet enabling them to disrupt markets by creating new product categories in record time. FR60 MB91460B Series, 32-bit Microcontroller Datasheet

MB91460B series is a line of general-purpose 32-bit RISC microcontrollers designed for embedded control applications which require high-speed real-time processing, such as consumer devices and on-board vehicle systems. This series uses the FR60 CPU, which is compatible with the FR family of CPUs.

This series contains the LIN-USART and CAN controllers.

Note: MB91F466BA, MB91F464BB - These devices are under development.

Features

FR60 CPU core

- 32-bit RISC, load/store architecture, five-stage pipeline
- 16-bit fixed-length instructions (basic instructions)
- Instruction execution speed: 1 instruction per cycle
- Instructions including memory-to-memory transfer, bit manipulation, and barrel shift instructions: Instructions suitable for embedded applications
- Function entry/exit instructions and register data multi-load store instructions: Instructions supporting C language
- Register interlock function: Facilitating assembly-language coding
- Built-in multiplier with instruction-level support
Signed 32-bit multiplication: 5 cycles
Signed 16-bit multiplication: 3 cycles
- Interrupts (save PC/PS): 6 cycles (16 priority levels)
- Harvard architecture enabling program access and data access to be performed simultaneously
- Instructions compatible with the FR family

Internal Peripheral Resources

- General-purpose ports: Maximum 108 ports
- DMAC (DMA Controller)
Maximum of 5 channels able to operate simultaneously
2 transfer sources (internal peripheral/software)
Activation source can be selected using software
Addressing mode specifies full 32-bit addresses (increment/decrement/fixed)
Transfer mode (demand transfer/burst transfer/step transfer/block transfer)
Transfer data size selectable from 8/16/32-bit
Multi-byte transfer enabled (by software)
DMAC descriptor in I/O areas (200_H to 240_H, 1000_H to 1024_H)
A/D converter (successive approximation type)
10-bit resolution: maximum 32 channels
Conversion time: minimum 1 μ s
- External interrupt inputs: maximum 16 channels
6 channels shared with CAN RX or I²C pins
- Bit search module (for REALOS)
Function to search the first bit position of "1", "0", "changed" from the MSB (most significant bit) within one word
- LIN-USART (full duplex double buffer): 4 or 7 channels, depending on pin multiplexing
Clock synchronous/asynchronous selectable
Sync-break detection
Internal dedicated baud rate generator
- I²C bus interface (supports 400 kbps): 2 channels
Master/slave transmission and reception
Arbitration function, clock synchronization function
- CAN controller (C-CAN): 3 or 6 channels (depending on the device)
Maximum transfer speed: 1 Mbps
32 transmission/reception message buffers
- Sound generator: 1 channel
Tone frequency : PWM frequency divide-by-two (reload value + 1)
- Alarm comparator: 1 channel
Monitor external voltage
Generate an interrupt in case of voltage lower/higher than the defined thresholds (reference voltage)
- 16-bit PPG timer: maximum 16 channels
- 16-bit reload timer: 8 channels
- 16-bit free-run timer: 8 channels (1 channel each for ICU and OCU)
- Input capture: maximum 8 channels (operates in conjunction with the free-run timer)
- Output compare: maximum 8 channels (operates in conjunction with the free-run timer)
- Up/Down counter: 2 channels (2*8-bit or 1*16-bit)
- Watchdog timer
- Real-time clock
- Low-power consumption modes: Sleep/stop mode function
- Low voltage detection circuit
- Clock supervisor
Monitors the sub-clock (32 kHz) and the main clock (4 MHz),

and switches to a recovery clock (CR oscillator, etc.) when the oscillations stop.

- Clock modulator
- Clock monitor
- Sub-clock calibration
Corrects the real-time clock timer when operating with the 32 kHz or CR oscillator

Package and Technology

- Package: QFP-144
- CMOS 180 nm technology

- Main oscillator stabilization timer
Generates an interrupt in sub-clock mode after the stabilization wait time has elapsed on the 23-bit stabilization wait time counter
- Sub-oscillator stabilization timer
Generates an interrupt in main clock mode after the stabilization wait time has elapsed on the 15-bit stabilization wait time counter
- Power supply range 3 V to 5 V (1.8 V internal logic provided by a step-down voltage converter)
- Operating temperature range: between -40°C and $+125^{\circ}\text{C}$

1. MPU channels use EDSU breakpoint registers (shared operation between MPU and EDSU).

2. Free Running Timer: MD3=0 : CH 1 and 0 cannot select external clock (bit7 of TCCS1,0)
MD3=1: CH 3, 2, 1, and 0 cannot select external clock (bit7 of TCCS3,2,1,0)

3. ICU: MD3=1: Do not set PFR = 1 & EPFR = 1 (for LIN Synch Field detect).
4. OCU: MD3=1: You cannot use external out-port (but, OCU-function is active.)
5. Reload Timer: MD3=1: CH 7, 6, 5, and 4 cannot select external event
6. PPG: MD3=1: You can use CH15 to 8 of PPG. CH15 to12 cannot select external trigger.
7. Up/Down Counter: MD3=1: You can use Timer-mode only.
8. LIN-USART CH 0 (shared with external bus) can be used for asynchronous mode only.
9. External Interrupts: INT7 to INT4(shared with external bus) can be used for MD3=0 mode only. INT0 (shared with external bus) can be used for MD3=0 mode only.

5. Handling Devices

5.1 Preventing Latch-up

Latch-up may occur in a CMOS IC if a voltage higher than (V_{DD5} , V_{DD35} or HV_{DD5} ^[1]) or less than (V_{SS5} or HV_{SS5} ^[1]) is applied to an input or output pin or if a voltage exceeding the rating is applied between the power supply pins and ground pins. If latch-up occurs, the power supply current increases rapidly, sometimes resulting in thermal breakdown of the device. Therefore, be very careful not to apply voltages in excess of the absolute maximum ratings.

Note: 1. HV_{DD5} , HV_{SS5} are available only on devices having Stepper Motor Controller.

5.2 Handling of Unused Input Pins

If unused input pins are left open, abnormal operation may result. Any unused input pins should be connected to pull-up or pull-down resistor (2K Ω to 10K Ω) or enable internal pullup or pulldown resistors (PPER/PPCR) before the input enable (PORTEN) is activated by software. The mode pins MD_x can be connected to V_{SS5} or V_{DD5} directly. Unused ALARM input pins can be connected to AV_{SS5} directly.

5.3 Power Supply Pins

In MB91460 series, devices including multiple power supply pins and ground pins are designed as follows; pins necessary to be at the same potential are interconnected internally to prevent malfunctions such as latch-up. All of the power supply pins and ground pins must be externally connected to the power supply and ground respectively in order to reduce unnecessary radiation, to prevent strobe signal malfunctions due to the ground level rising and to follow the total output current ratings. Furthermore, the power supply pins and ground pins of the MB91460 series must be connected to the current supply source via a low impedance. It is also recommended to connect a ceramic capacitor of approximately 0.1 μ F as a bypass capacitor between power supply pin and ground pin near this device. This series has a built-in step-down regulator. Connect a bypass capacitor of 4.7 μ F (use a X7R ceramic capacitor) to VCC18C pin for the regulator.

5.4 Crystal Oscillator Circuit

Noise in proximity to the X0 (X0A) and X1 (X1A) pins can cause the device to operate abnormally. Printed circuit boards should be designed so that the X0 (X0A) and X1 (X1A) pins, and crystal oscillator, as well as bypass capacitors connected to ground, are located near the device and ground.

It is recommended that the printed circuit board layout be designed such that the X0 and X1 pins or X0A and X1A pins are surrounded by ground plane for the stable operation. Please request the oscillator manufacturer to evaluate the oscillational characteristics of the crystal and this device.

5.5 Notes on using External Clock

When using the external clock, it is necessary to simultaneously supply the X0 (X0A) and the X1 (X1A) pins. In the described combination, X1 (X1A) should be supplied with a clock signal which has the opposite phase to the X0 (X0A) pins. At X0 and X1, a frequency up to 16 MHz is possible.

Figure 1. Example of using opposite phase supply

5.6 Mode Pins (MD_x)

These pins should be connected directly to the power supply or ground pins. To prevent the device from entering test mode accidentally due to noise, minimize the lengths of the patterns between each mode pin and power supply pin or ground pin on the printed circuit board as possible and connect them with low impedance.

5.7 Notes on Operating in PLL Clock Mode

If the oscillator is disconnected or the clock input stops when the PLL clock is selected, the microcontroller may continue to operate at the free-running frequency of the self-oscillating circuit of the PLL. However, this self-running operation cannot be guaranteed.

5.8 Pull-up Control

The AC standard is not guaranteed in case a pull-up resistor is connected to the pin serving as an external bus pin.

6. Notes on Debugger

6.1 Execution of the RETI Command

If single-step execution is used in an environment where an interrupt occurs frequently, the corresponding interrupt handling routine will be executed repeatedly to the exclusion of other processing. This will prevent the main routine and the handlers for low priority level interrupts from being executed (For example, if the time-base timer interrupt is enabled, stepping over the RETI instruction will always break on the first line of the time-base timer interrupt handler).

Disable the corresponding interrupts when the corresponding interrupt handling routine no longer needs debugging.

6.2 Break Function

If the range of addresses that cause a hardware break (including event breaks) is set to the address of the current system stack pointer or to an area that contains the stack pointer, execution will break after each instruction regardless of whether the user program actually contains data access instructions.

To prevent this, do not set (word) access to the area containing the address of the system stack pointer as the target of the hardware break (including an event breaks).

6.3 Operand Break

It may cause malfunctions if a stack pointer exists in the area which is set as the DSU operand break. Do not set the access to the areas containing the address of system stack pointer as a target of data event break.

6.4 Notes on PS Register

As the PS register is processed in advance by some instructions, when the debugger is being used, the exception handling may result in execution breaking in an interrupt handling routine or the displayed values of the flags in the PS register being updated. As the microcontroller is designed to carry out reprocessing correctly upon returning from such an EIT event, the operation before and after the EIT always proceeds according to specification.

■ **The following behavior may occur if any of the following occurs in the instruction immediately after a DIV0U/DIV0S instruction:**

- (a) a user interrupt or NMI is accepted;
- (b) single-step execution is performed;
- (c) execution breaks due to a data event or from the emulator menu.
 - 1. D0 and D1 flags are updated in advance.
 - 2. An EIT handling routine (user interrupt/NMI or emulator) is executed.
 - 3. Upon returning from the EIT, the DIV0U/DIV0S instruction is executed and the D0 and D1 flags are updated to the same values as those in 1.

■ **The following behavior occurs when an ORCCR, STILM, MOV Ri,PS instruction is executed to enable a user interrupt or NMI source while that interrupt is in the active state.**

- 1. The PS register is updated in advance.
- 2. An EIT handling routine (user interrupt/NMI or emulator) is executed.
- 3. Upon returning from the EIT, the above instructions are executed and the PS register is updated to the same value as in 1.

8. CPU and Control Unit

The FR family CPU is a high performance core that is designed based on the RISC architecture with advanced instructions for embedded applications.

8.1 Features

- Adoption of RISC architecture
Basic instruction: 1 instruction per cycle
- General-purpose registers: 32-bit × 16 registers
- 4 Gbytes linear memory space
- Multiplier installed
32-bit × 32-bit multiplication: 5 cycles
16-bit × 16-bit multiplication: 3 cycles
- Enhanced interrupt processing function
Quick response speed (6 cycles)
Multiple-interrupt support
Level mask function (16 levels)
- Enhanced instructions for I/O operation
Memory-to-memory transfer instruction
Bit processing instruction
Basic instruction word length: 16 bits
- Low-power consumption
Sleep mode/stop mode

8.2 Internal Architecture

- The FR family CPU uses the Harvard architecture in which the instruction bus and data bus are independent of each other.
- A 32-bit ↔ 16-bit buffer is connected to the 32-bit bus (D-bus) to provide an interface between the CPU and peripheral resources.
- A Harvard ↔ Princeton bus converter is connected to both the I-bus and D-bus to provide an interface between the CPU and the bus controller.

8.3 Programming Model

8.3.1 Basic Programming Model

8.4 Registers

8.4.1 General-Purpose Register

Registers R0 to R15 are general-purpose registers. These registers can be used as accumulators for computation operations and as pointers for memory access.

Of the 16 registers, enhanced commands are provided for the following registers to enable their use for particular applications.

R13 : Virtual accumulator

R14 : Frame pointer

R15 : Stack pointer

Initial values at reset are undefined for R0 to R14. The value for R15 is 00000000_H (SSP value).

8.4.2 PS (Program Status)

This register holds the program status, and is divided into three parts, ILM, SCR, and CCR.

All undefined bits (-) in the diagram are reserved bits. The read values are always "0". Write access to these bits is invalid.

8.4.3 CCR (Condition Code Register)

SV: Supervisor flag

S: Stack flag

I: Interrupt enable flag

N: Negative enable flag

Z: Zero flag

V: Overflow flag

C: Carry flag

8.4.4 SCR (System Condition Register)

Flag for step division (D1, D0)

This flag stores interim data during execution of step division.

Step trace trap flag (T)

This flag indicates whether the step trace trap is enabled or disabled.

The step trace trap function is used by emulators. When an emulator is in use, it cannot be used in execution of user programs.

8.4.5 ILM (Interrupt Level Mask Register)

This register stores interrupt level mask values, and the values stored in ILM4 to ILM0 are used for level masking.

The register is initialized to value "01111_B" at reset.

8.4.6 PC (Program Counter)

The program counter indicates the address of the instruction that is being executed.

The initial value at reset is undefined.

8.4.7 TBR (Table Base Register)

The table base register stores the starting address of the vector table used in EIT processing.

The initial value at reset is 000FFC00_H.

8.4.8 RP (Return Pointer)

The return pointer stores the address for return from subroutines.

During execution of a CALL instruction, the PC value is transferred to this RP register.

During execution of a RET instruction, the contents of the RP register are transferred to PC.

The initial value at reset is undefined.

8.4.9 USP (User Stack Pointer)

The user stack pointer, when the S flag is "1", this register functions as the R15 register.

■ The USP register can also be explicitly specified.

The initial value at reset is undefined.

■ This register cannot be used with RETI instructions.

8.4.10 Multiply & Divide Registers

These registers are for multiplication and division, and are each 32 bits in length.

The initial value at reset is undefined.

9. Embedded Program/Data Memory (Flash)

9.1 Flash features

- MB91F467BA: 1088 Kbytes ($16 \times 64 \text{ Kbytes} + 8 \times 8 \text{ Kbytes} = 8.5 \text{ Mbits}$)
- MB91F466BA: 832 Kbytes ($12 \times 64 \text{ Kbytes} + 8 \times 8 \text{ Kbytes} = 6.5 \text{ Mbits}$)
- MB91F465BB: 544 Kbytes ($8 \times 64 \text{ Kbytes} + 4 \times 8 \text{ Kbytes} = 4.25 \text{ Mbits}$)
- MB91F464BB: 416 Kbytes ($6 \times 64 \text{ Kbytes} + 4 \times 8 \text{ Kbytes} = 3.25 \text{ Mbits}$)
- Programmable wait states for read/write access
- Flash and Boot security with security vector at 0x0014:8000 - 0x0014:800F
- Boot security
- Basic specification: Same as MBM29LV400TC (except size and part of sector configuration)

9.2 Operation Modes

9.2.1 64-bit CPU mode (available on MB91F467BA/466BA only) :

- CPU reads and executes programs in word (32-bit) length units.
- Flash writing is not possible.
- Actual Flash Memory access is performed in d-word (64-bit) length units.

9.2.2 32-bit CPU mode:

- CPU reads and executes programs in word (32-bit) length units.
- Actual Flash Memory access is performed in word (32-bit) length units.

9.2.3 16-bit CPU mode:

- CPU reads and writes in half-word (16-bit) length units.
- Program execution from the Flash is not possible.
- Actual Flash Memory access is performed in word (16-bit) length units.

9.2.4 Flash Memory Mode (External Access to Flash Memory Enabled)

Note: The operation mode of the flash memory can be selected using a Boot-ROM function. The function start address is 0xBF60. The parameter description is given in the Hardware Manual in chapter 54.6 "Flash Access Mode Switching".

9.4.2 Pin Connections in Parallel Programming Mode

Resetting after setting the MD[2:0] pins to [111] will halt CPU functioning. At this time, the Flash memory's interface circuit enables direct control of the Flash memory unit from external pins by directly linking some of the signals to GP-Ports. Please see table below for signal mapping.

In this mode, the Flash memory appears to the external pins as a stand-alone unit. This mode is generally set when writing/erasing using the parallel Flash programmer. In this mode, all operations of the 8.5 Mbits Flash memory's Auto Algorithms are available.

1. A19 is used as address bit on MB91F467BA/F466BA. For MB91F465BB/F464BB, set this pin to '1'.
2. For MB91F467BA/F466BA, set this pin to '1'. For MB91F465BB/F464BB, this pin can be left open.

9.5 Poweron Sequence in Parallel Programming Mode

The flash memory can be accessed in programming mode after a certain wait time, which is needed for Security Vector fetch:

- Minimum wait time after VDD5/VDD5R power on: 2.76 ms
- Minimum wait time after INITX rising: 1.0 ms

9.6 Flash Security

9.6.1 Vector Addresses

Two Flash Security Vectors (FSV1, FSV2) are located parallel to the Boot Security Vectors (BSV1, BSV2) controlling the protection functions of the Flash Security Module:

FSV1: 0x14:8000 BSV1: 0x14:8004
 FSV2: 0x14:8008 BSV2: 0x14:800C

9.6.2 Security Vector FSV1

The setting of the Flash Security Vector FSV1 is responsible for the read and write protection modes and the individual write protection of the 8 KBytes sectors.

9.6.2.1 FSV1 (bit31 to bit16)

The setting of the Flash Security Vector FSV1 bits [31:16] is responsible for the read and write protection modes.

Table 2. Explanation of the bits in the Flash Security Vector FSV1[31:16]

9.6.2.2 FSV1 (bit15 to bit0) MB91F467BA/466BA

The setting of the Flash Security Vector FSV1 bits [15:0] is responsible for the individual write protection of the 8 KBytes sectors. It is only evaluated if write protection bit FSV1[17] is set.

Table 3. Explanation of the bits in the Flash Security Vector FSV1[15:0]

FSV1 bit	Sector	Enable Write Protection	Disable Write Protection	Comment
FSV1[0]	SA0	set to "0"	set to "1"

Note: It is mandatory to always set the sector where the Flash Security Vectors FSV1 and FSV2 are located to write protected (here sector SA4). Otherwise it is possible to overwrite the Security Vector to a setting where it is possible to either read out the Flash content or manipulate data by writing. See section "Flash access in CPU mode" for an overview about the sector organisation of the Flash Memory.

9.6.2.3 FSV1 (bit15 to bit0) MB91F465BB/464BB

The setting of the Flash Security Vector FSV1 bits [15:0] is responsible for the individual write protection of the 8 KBytes sectors. It is only evaluated if write protection bit FSV1[17] is set.

See section "Flash access in CPU mode" for an overview about the sector organisation of the Flash Memory.

9.6.3 Security Vector FSV2 MB91F467BA/466BA

The setting of the Flash Security Vector FSV2 bits [31:0] is responsible for the individual write protection of the 64 KByte sectors. It is only evaluated if write protection bit FSV1[17] is set.

10. Memory Space

The FR family has 4 Gbytes of logical address space (2^{32} addresses) available to the CPU by linear access.

■ Direct addressing area

The following address space area is used for I/O.

This area is called direct addressing area, and the address of an operand can be specified directly in an instruction.

The size of directly addressable area depends on the length of the data being accessed as shown below.

Byte data access: 000_H to $0FF_H$

Half word access: 000_H to $1FF_H$

Word data access: 000_H to $3FF_H$

1. The Interrupt Control Registers (ICRs) are located in the interrupt controller and set the interrupt level for each interrupt request. An ICR is provided for each interrupt request.
2. The vector address for each EIT (exception, interrupt or trap) is calculated by adding the listed offset to the table base register value (TBR) . The TBR specifies the top of the EIT vector table. The addresses listed in the table are for the default TBR value (000FFC00_H) . The TBR is initialized to this value by a reset. The TBR is set to 000FFC00_H after the internal boot ROM is executed.
3. ICR23 and ICR47 can be exchanged by setting the REALOS compatibility bit (addr 0C03_H : IOS[0])
4. Used by REALOS
5. Memory Protection Unit (MPU) support

14.1 PLL and Clock Gear Settings

Please note that for MB91F467BA/466BA and MB91F465BB/464BB the core base clock frequencies are valid in the 1.8V operation mode of the Main regulator and Flash.

14.2 Clock Modulator settings

The following table shows all possible settings for the Clock Modulator in a base clock frequency range from 32MHz up to 88MHz.

The Flash access time settings need to be adjusted according to Fmax while the PLL and clockgear settings should be set according to base clock frequency.

- Use within recommended operating conditions.
- Use with DC voltage (current).
- +B signals are input signals that exceed the V_{DD5} voltage. +B signals should always be applied by connecting a limiting resistor between the +B signal and the microcontroller.
- The value of the limiting resistor should be set so that the current input to the microcontroller pin does not exceed the rated value at any time, either instantaneously or for an extended period, when the +B signal is input.
- Note that when the microcontroller drive current is low, such as in the low power consumption modes, the +B input potential can increase the potential at the power supply pin via a protective diode, possibly affecting other devices.
- Note that if the +B signal is input when the microcontroller is off (not fixed at 0 V), power is supplied through the +B input pin; therefore, the microcontroller may partially operate.
- Note that if the +B signal is input at power-on, since the power is supplied through the pin, the power-on reset may not function in the power supply voltage.
- Do not leave +B input pins open.

Figure 2. Example of recommended circuit :

4. Maximum output current is defined as the value of the peak current flowing through any one of the corresponding pins.
5. Average output current is defined as the value of the average current flowing through any one of the corresponding pins for a 100 ms period.
6. Total average output current is defined as the value of the average current flowing through all of the corresponding pins for a 100 ms period.
7. The maximum permitted power dissipation depends on the ambient temperature, the air flow velocity and the thermal conductance of the package on the PCB.

The actual power dissipation depends on the customer application and can be calculated as follows:

$$P_D = P_{IO} + P_{INT}$$

$$P_{IO} = \sum (V_{OL} * I_{OL} + V_{OH} * I_{OH}) \text{ (IO load power dissipation, sum is performed on all IO ports)}$$

$$P_{INT} = V_{DD}5R * I_{CC} + AV_{CC}5 * I_A + AVRH5 * I_R \text{ (internal power dissipation)}$$

8. Worst case value for the QFP package mounted on a 4-layer PCB at specified T_A without air flow.
9. Please contact Fujitsu for reliability limitations when using under these conditions.

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

	$f_{RC2\text{MHz}}$	1	2	4	MHz	

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

Conversion Time Calculation

$$T_{\text{conv}} = T_{\text{samp}} + T_{\text{comp}}$$

15.4.1 Definition of A/D Converter Terms

■ Resolution

Analog variation that is recognizable by the A/D converter.

■ Nonlinearity error

Deviation between actual conversion characteristics and a straight line connecting the zero transition point (00 0000 0000_B ↔ 00 0000 0001_B) and the full scale transition point (11 1111 1110_B ↔ 11 1111 1111_B).

■ Differential nonlinearity error

Deviation of the input voltage from the ideal value that is required to change the output code by 1 LSB.

■ Total error

This error indicates the difference between actual and theoretical values, including the zero transition error, full scale transition error, and nonlinearity error.

$$1\text{LSB}' (\text{ideal value}) = \frac{AVRH - AV_{SS5}}{1024} [V]$$

$$\text{Total error of digital output } N = \frac{V_{NT} - \{1 \text{ LSB}' \times (N - 1) + 0.5 \text{ LSB}'\}}{1 \text{ LSB}'}$$

N: A/D converter digital output value

$$V_{OT}' (\text{ideal value}) = AV_{SS5} + 0.5 \text{ LSB}' [V]$$

$$V_{FST}' (\text{ideal value}) = AVRH - 1.5 \text{ LSB}' [V]$$

V_{NT} : Voltage at which the digital output changes from $(N + 1)_H$ to N_H

$$\text{Nonlinearity error of digital output } N = \frac{V_{NT} - \{1\text{LSB} \times (N - 1) + V_{OT}\}}{1\text{LSB}} \quad [\text{LSB}]$$

$$\text{Differential nonlinearity error of digital output } N = \frac{V_{(N+1)T} - V_{NT}}{1\text{LSB}} - 1 \quad [\text{LSB}]$$

$$1\text{LSB} = \frac{V_{FST} - V_{OT}}{1022} \quad [\text{V}]$$

N: A/D converter digital output value

V_{OT} : Voltage at which the digital output changes from 000_H to 001_H.

V_{FST} : Voltage at which the digital output changes from 3FE_H to 3FF_H.

1. Parameter m depends on t_{SCYCI} and can be calculated as :

- if $t_{SCYCI} = 2 \times k \times t_{CLKP}$, then $m = k$, where k is an integer > 2
- if $t_{SCYCI} = (2 \times k + 1) \times t_{CLKP}$, then $m = k + 1$, where k is an integer > 1

Notes :

- The above values are AC characteristics for CLK synchronous mode.
- t_{CLKP} is the cycle time of the peripheral clock.

15.7.4 I²C AC Timings at V_{DD5} = 3.0 to 5.5 V

■ Conditions during AC measurements

All AC tests were measured under the following conditions:

- -I_{Odrive} = 3 mA
- -V_{DD5} = 3.0 V to 5.5 V, I_{load} = 3 mA
- -V_{SS5} = 0 V
- -T_a = -40 °C to +125 °C
- -C_I = 50 pF
- -VOL = 0.3 × V_{DD5}
- -VOH = 0.7 × V_{DD5}
- -EPILR = 0, PILR = 0 (CMOS Hysteresis 0.3 × V_{DD5}/0.7 × V_{DD5})

15.7.4.1 Fast mode:

(V_{DD5} = 3.5 V to 5.5 V, V_{SS5} = AV_{SS5} = 0 V, T_A = -40 °C to +125 °C)

Parameter	Symbol	Pin name	Value		Unit	Remark
			Min	Max		
SCL clock frequency	f _{SCL}	SCLn	0	400	kHz	
Hold time (repeated) START condition. After this period, the first clock pulse is generated	t _{HD;STA}	SCLn, SDAn	0.6	–	μs	
LOW period of the SCL clock	t _{LOW}	SCLn	1.3	–	μs	
HIGH period of the SCL clock	t _{HIGH}	SCLn	0.6	–	μs	
Setup time for a repeated START condition	t _{SU;STA}	SCLn, SDAn	0.6	–	μs	
Data hold time for I ² C-bus devices	t _{HD;DAT}	SCLn, SDAn	0	0.9	μs	
Data setup time	t _{SU;DAT}	SCLn, SDAn	100	–	ns	
Rise time of both SDA and SCL signals	t _r	SCLn, SDAn	20 + 0.1Cb	300	ns	
Fall time of both SDA and SCL signals	t _f	SCLn, SDAn	20 + 0.1Cb	300	ns	
Setup time for STOP condition	t _{SU;STO}	SCLn, SDAn	0.6	–	μs	
Bus free time between a STOP and START condition	t _{BUF}	SCLn, SDAn	1.3	–	μs	
Capacitive load for each bus line	C _b	SCLn, SDAn	–	400	pF	
Pulse width of spike suppressed by input filter	t _{SP}	SCLn, SDAn	0	(1..1.5) × t _{CLKP}	ns	[1]

1. The noise filter will suppress single spikes with a pulse width of 0ns and between (1 to 1.5) cycles of peripheral clock, depending on the phase relationship between I²C signals (SDA, SCL) and peripheral clock.

Note: t_{CLKP} is the cycle time of the peripheral clock.

15.7.5 Free-Run Timer Clock

($V_{DD5} = 3.0\text{ V to }5.5\text{ V}$, $V_{SS5} = AV_{SS5} = 0\text{ V}$, $T_A = -40\text{ }^{\circ}\text{C to }+125\text{ }^{\circ}\text{C}$)

15.7.7 External Bus AC Timings at $V_{DD35} = 3.0$ to 5.5 V

Note: This chapter is applicable to MB91F467BA/F466BA

■ Conditions during AC measurements

All AC tests were measured under the following conditions:

- $-I_{Odrive} = 5$ mA
- $-V_{DD35} = 4.5$ V to 5.5 V, $I_{load} = 3$ mA
- $-V_{SS5} = 0$ V
- $-T_a = -40$ °C to $+125$ °C
- $-C_I = 50$ pF
- $-VOL = 0.5 \times V_{DD35}$
- $-VOH = 0.5 \times V_{DD35}$
- $-EPILR = 0$, $PILR = 1$ (Automotive Level = worst case)

15.7.7.1 Basic Timing

Spanion Publication Number: DS07-16609-1E

Version	Date	Remark
2.0	2008-06-19	Initial version
2.1	2008-08-15	Proof reading results from FJ incorporated; Corrected pinout drawings; IO CIRCUIT TYPES: corrected some typos like on the other datasheets; HANDLING DEVICES: updated the section "Notes on PS register" for better understanding; Interrupt Vector Table: corrected the footnotes FLASH: added note about the operation mode switching capability in Boot ROM; corrected flash security vector FSV2 assignments, corrected section about parallel programming, corrected section pin connections in parallel programming mode so that there is only one page added section "Poweron Sequence in parallel programming mode"; ELECTRICAL CHARACTERISTICS: removed the note that analog input/output pins cannot accept +B signal input; splitted I_{LV} into external and internal LV detection current ADC Characteristics: Corrected the items about nonlinearity error; Corrected the company name
3.0	2009-01-09	Page 1: Corrected document name field in top header Block Diagram: Removed SCK0 (LIN-USART0 is asynchronous only) Added Ta=125C characteristics

19. Main Changes in this Edition

Page	Section	Change Results
104	15. Electrical Characteristics 15.4. A/D converter characteristics	Corrected the column "Value" and "Unit" of the parameter "Zero reading voltage" and "Full scale reading voltage". (Value : AVRL - 1.5 → AVRL - 1.5 LSB AVRL + 0.5 → AVRL + 0.5 LSB AVRL + 2.5 → AVRL + 2.5 LSB AVRH - 3.5 → AVRH - 3.5 LSB AVRH - 1.5 → AVRH - 1.5 LSB AVRH + 0.5 → AVRH + 0.5 LSB Unit : LSB → V)
