## Functional Description

The CY62128EV30 is a high performance CMOS static RAM module organized as 128K words by 8-bits. This device features advanced circuit design to provide ultra low active current. This is ideal for providing More Battery Life™ (MoBL®) in portable applications such as cellular telephones. The device also has an automatic power-down feature that significantly reduces power consumption when addresses are not toggling. Placing the device in standby mode reduces power consumption by more than 99 percent when deselected ( $\overline{CE}_1$  HIGH or  $CE_2$  LOW). The eight input and output pins ( $I/O_0$  through  $I/O_7$ ) are placed in a high impedance state when the device is deselected ( $\overline{CE}_1$  HIGH or  $CE_2$  LOW), the outputs are disabled ( $\overline{OE}$  HIGH), or a write operation is in progress ( $CE_1$  LOW and  $CE_2$  HIGH and  $WE$  LOW).

To write to the device, take chip enable ( $\overline{CE}_1$  LOW and  $CE_2$  HIGH) and write enable ( $WE$ ) inputs LOW. Data on the eight I/O pins is then written into the location specified on the address pin ( $A_0$  through  $A_{16}$ ).

To read from the device, take chip enable ( $\overline{CE}_1$  LOW and  $CE_2$  HIGH) and output enable ( $\overline{OE}$ ) LOW while forcing write enable ( $WE$ ) HIGH. Under these conditions, the contents of the memory location specified by the address pins appear on the I/O pins.

15. Test Conditions for all parameters other than tri-state parameters assume signal transition time of 3 ns or less (1 V/ns), timing reference levels of  $V_{CC(typ)}/2$ , input pulse levels of 0 to  $V_{CC(typ)}$ , and output loading of the specified  $I_{OL}/I_{OH}$  as shown in the [AC Test Loads and Waveforms on page 5](#).
16. At any given temperature and voltage condition,  $t_{HZCE}$  is less than  $t_{LZCE}$ ,  $t_{HZOE}$  is less than  $t_{LZOE}$ , and  $t_{HZWE}$  is less than  $t_{LZWE}$  for any given device.
17.  $t_{HZOE}$ ,  $t_{HZCE}$ , and  $t_{HZWE}$  transitions are measured when the output enter a high impedance state.
18. The internal write time of the memory is defined by the overlap of  $\overline{WE}$ ,  $\overline{CE} = V_{IL}$ . All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing should be referenced to the edge of the signal that terminates the write.
