CY7C1470V33
CY7C1472V33
CY7C1474V33

72-Mbit (2 M × 36/4 M × 18/1 M × 72) Pipelined SRAM with NoBL™ Architecture

Features

- Pin compatible and functionally equivalent to ZBT

- Supports 200 MHz Bus operations with zero wait states
  - Available speed grades are 200 and 167 MHz

- Internally self timed output buffer control to eliminate the need to use asynchronous $\overline{OE}$

- Fully registered (inputs and outputs) for pipelined operation

- Byte write capability

- Single 3.3 V power supply

- 3.3 V/2.5 V I/O power supply

- Fast clock-to-output time
  - 3.0 ns (for 200 MHz device)

- Clock enable ($\overline{CEN}$) pin to suspend operation

- Synchronous self timed writes

- CY7C1470V33 available in JEDEC-standard Pb-free 100-pin TQFP, and non Pb-free 165-ball FBGA package. CY7C1472V33 available in JEDEC-standard Pb-free 100-pin TQFP. CY7C1474V33 available in non Pb-free 209-ball FBGA package

- IEEE 1149.1 JTAG boundary scan compatible

- Burst capability – linear or interleaved burst order

- "ZZ" sleep mode option and stop clock option

Functional Description

The CY7C1470V33, CY7C1472V33, and CY7C1474V33 are 3.3 V, 2 M × 36/4 M × 18/1 M × 72 synchronous pipelined burst SRAMs with No Bus Latency™ (NoBL™) logic, respectively. They are designed to support unlimited true back-to-back read/write operations with no wait states. The CY7C1470V33, CY7C1472V33, and CY7C1474V33 are equipped with the advanced (NoBL) logic required to enable consecutive read/write operations with data being transferred on every clock cycle. This feature dramatically improves the throughput of data in systems that require frequent write/read transitions. The CY7C1470V33, CY7C1472V33, and CY7C1474V33 are pin compatible and functionally equivalent to ZBT devices.

All synchronous inputs pass through input registers controlled by the rising edge of the clock. All data outputs pass through output registers controlled by the rising edge of the clock. The clock input is qualified by the clock enable ($\overline{CEN}$) signal, which when deasserted suspends operation and extends the previous clock cycle.

Write operations are controlled by the byte write selects (BW_a–BW_h for CY7C1474V33, BW_a–BW_d for CY7C1470V33 and BW_a–BW_b for CY7C1472V33) and a write enable ($\overline{WE}$) input. All writes are conducted with on-chip synchronous self timed write circuitry.

Three synchronous chip enables ($\overline{CE}_1$, CE_2, $\overline{CE}_3$) and an asynchronous output enable ($\overline{OE}$) provide for easy bank selection and output tristate control. In order to avoid bus contention, the output drivers are synchronously tristated during the data portion of a write sequence.

Selection Guide

| Description	200 MHz	167 MHz	Unit
Maximum access time	3.0	3.4	ns
Maximum operating current	500	450	mA
Maximum CMOS standby current	120	120	mA

Pin Definitions

Pin Name	I/O Type	Pin Description
A_0, A_1, A	Input-synchronous	**Address inputs used to select one of the address locations**. Sampled at the rising edge of the CLK.
$\overline{BW_a}$, $\overline{BW_b}$, $\overline{BW_c}$, $\overline{BW_d}$, $\overline{BW_e}$, $\overline{BW_f}$, BW_g, BW_h	Input-synchronous	**Byte write select inputs, active LOW**. Qualified with $\overline{WE}$ to conduct writes to the SRAM. Sampled on the rising edge of CLK. BW_a controls DQ_a and DQP_a, BW_b controls DQ_b and DQP_b, BW_c controls DQ_c and DQP_c, BW_d controls DQ_d and DQP_d, BW_e controls DQ_e and DQP_e, BW_f controls DQ_f and DQP_f, BW_g controls DQ_g and DQP_g, BW_h controls DQ_h and DQP_h.
$\overline{WE}$	Input-synchronous	**Write enable input, active LOW**. Sampled on the rising edge of CLK if $\overline{CEN}$ is active LOW. This signal must be asserted LOW to initiate a write sequence.
ADV/$\overline{LD}$	Input-synchronous	**Advance/load input used to advance the on-chip address counter or load a new address**. When HIGH (and $\overline{CEN}$ is asserted LOW) the internal burst counter is advanced. When LOW, a new address can be loaded into the device for an access. After being deselected, ADV/$\overline{LD}$ should be driven LOW in order to load a new address.
CLK	Input-clock	**Clock input**. Used to capture all synchronous inputs to the device. CLK is qualified with $\overline{CEN}$. CLK is only recognized if $\overline{CEN}$ is active LOW.
$\overline{CE_1}$	Input-synchronous	**Chip enable 1 input, active LOW**. Sampled on the rising edge of CLK. Used in conjunction with CE_2 and $\overline{CE_3}$ to select/deselect the device.
CE_2	Input-synchronous	**Chip enable 2 input, active HIGH**. Sampled on the rising edge of CLK. Used in conjunction with $\overline{CE_1}$ and $\overline{CE_3}$ to select/deselect the device.
$\overline{CE_3}$	Input-synchronous	**Chip enable 3 input, active LOW**. Sampled on the rising edge of CLK. Used in conjunction with $\overline{CE_1}$ and CE_2 to select/deselect the device.
$\overline{OE}$	Input-asynchronous	**Output enable, active LOW**. Combined with the synchronous logic block inside the device to control the direction of the I/O pins. When LOW, the I/O pins are allowed to behave as outputs. When deasserted HIGH, I/O pins are tristated, and act as input data pins. OE is masked during the data portion of a write sequence, during the first clock when emerging from a deselected state and when the device has been deselected.
$\overline{CEN}$	Input-synchronous	**Clock enable input, active LOW**. When asserted LOW the clock signal is recognized by the SRAM. When deasserted HIGH the clock signal is masked. Since deasserting $\overline{CEN}$ does not deselect the device, $\overline{CEN}$ can be used to extend the previous cycle when required.
DQ_S	I/O-synchronous	**Bidirectional data I/O lines**. As inputs, they feed into an on-chip data register that is triggered by the rising edge of CLK. As outputs, they deliver the data contained in the memory location specified by $A_{[17:0]}$ during the previous clock rise of the read cycle. The direction of the pins is controlled by $\overline{OE}$ and the internal control logic. When $\overline{OE}$ is asserted LOW, the pins can behave as outputs. When HIGH, DQ_a–DQ_d are placed in a tristate condition. The outputs are automatically tristated during the data portion of a write sequence, during the first clock when emerging from a deselected state, and when the device is deselected, regardless of the state of $\overline{OE}$.
DQP_X	I/O-synchronous	**Bidirectional data parity I/O lines**. Functionally, these signals are identical to DQ_X. During write sequences, DQP_a is controlled by $\overline{BW_a}$, DQP_b is controlled by $\overline{BW_b}$, DQP_c is controlled by $\overline{BW_c}$, and DQP_d is controlled by $\overline{BW_d}$, DQP_e is controlled by $\overline{BW_e}$, DQP_f is controlled by $\overline{BW_f}$, DQP_g is controlled by $\overline{BW_g}$, DQP_h is controlled by $\overline{BW_h}$.
MODE	Input strap pin	**Mode input**. Selects the burst order of the device. Tied HIGH selects the interleaved burst order. Pulled LOW selects the linear burst order. MODE should not change states during operation. When left floating MODE will default HIGH, to an interleaved burst order.
TDO	JTAG serial output synchronous	**Serial data-out to the JTAG circuit**. Delivers data on the negative edge of TCK.
TDI	JTAG serial input Synchronous	**Serial data-in to the JTAG circuit**. Sampled on the rising edge of TCK.

Pin Definitions *(continued)*

Pin Name	I/O Type	Pin Description
TMS	Test mode select synchronous	**This pin controls the test access port state machine**. Sampled on the rising edge of TCK.
TCK	JTAG clock	**Clock input to the JTAG circuitry**.
V_{DD}	Power supply	**Power supply inputs to the core of the device**.
V_{DDQ}	I/O power supply	**Power supply for the I/O circuitry**.
V_{SS}	Ground	**Ground for the device**. Should be connected to ground of the system.
NC	–	**No connects**. This pin is not connected to the die.
NC (144M, 288M, 576M, 1G)	–	**These pins are not connected**. They will be used for expansion to the 144M, 288M, 576M, and 1G densities.
ZZ	Input-asynchronous	**ZZ "Sleep" input**. This active HIGH input places the device in a non-time critical "sleep" condition with data integrity preserved. During normal operation, this pin has to be LOW or left floating. ZZ pin has an internal pull-down.

Functional Overview

The CY7C1470V33, CY7C1472V33, and CY7C1474V33 are synchronous-pipelined burst NoBL SRAMs designed specifically to eliminate wait states during write/read transitions. All synchronous inputs pass through input registers controlled by the rising edge of the clock. The clock signal is qualified with the clock enable input signal (CEN). If CEN is HIGH, the clock signal is not recognized and all internal states are maintained. All synchronous operations are qualified with CEN. All data outputs pass through output registers controlled by the rising edge of the clock. Maximum access delay from the clock rise (t_{CO}) is 3.0 ns (200 MHz device).

Accesses can be initiated by asserting all three chip enables ($\overline{CE}_1$, CE_2, $\overline{CE}_3$) active at the rising edge of the clock. If clock enable (CEN) is active LOW and ADV/LD is asserted LOW, the address presented to the device will be latched. The access can either be a read or write operation, depending on the status of the write enable ($\overline{WE}$). $BW_{[x]}$ can be used to conduct byte write operations.

Write operations are qualified by the write enable ($\overline{WE}$). All writes are simplified with on-chip synchronous self timed write circuitry.

Three synchronous chip enables ($\overline{CE}_1$, CE_2, $\overline{CE}_3$) and an asynchronous output enable ($\overline{OE}$) simplify depth expansion. All operations (reads, writes, and deselects) are pipelined. ADV/LD should be driven LOW after the device has been deselected in order to load a new address for the next operation.

Single Read Accesses

A read access is initiated when the following conditions are satisfied at clock rise: (1) CEN is asserted LOW, (2) $\overline{CE}_1$, CE_2, and $\overline{CE}_3$ are all asserted active, (3) the write enable input signal $\overline{WE}$ is deasserted HIGH, and (4) ADV/LD is asserted LOW. The address presented to the address inputs is latched into the address register and presented to the memory core and control logic. The control logic determines that a read access is in progress and allows the requested data to propagate to the input of the output register. At the rising edge of the next clock the requested data is allowed to propagate through the output register and onto the data bus within 3.0 ns (200 MHz device) provided $\overline{OE}$ is active LOW. After the first clock of the read access the output buffers are controlled by $\overline{OE}$ and the internal control logic. $\overline{OE}$ must be driven LOW in order for the device to drive out the requested data. During the second clock, a subsequent operation (read/write/deselect) can be initiated. Deselecting the device is also pipelined. Therefore, when the SRAM is deselected at clock rise by one of the chip enable signals, its output will tristate following the next clock rise.

Burst Read Accesses

The CY7C1470V33, CY7C1472V33, and CY7C1474V33 have an on-chip burst counter that allows the user the ability to supply a single address and conduct up to four reads without reasserting the address inputs. ADV/LD must be driven LOW in order to load a new address into the SRAM, as described in the Single Read Accesses section above. The sequence of the burst counter is determined by the MODE input signal. A LOW input on MODE selects a linear burst mode, a HIGH selects an interleaved burst sequence. Both burst counters use A0 and A1 in the burst sequence, and will wrap-around when incremented sufficiently. A HIGH input on ADV/LD will increment the internal burst counter regardless of the state of chip enables inputs or WE. WE is latched at the beginning of a burst cycle. Therefore, the type of access (read or write) is maintained throughout the burst sequence.

Single Write Accesses

Write accesses are initiated when the following conditions are satisfied at clock rise: (1) CEN is asserted LOW, (2) $\overline{CE}_1$, CE_2, and $\overline{CE}_3$ are all asserted active, and (3) the write signal $\overline{WE}$ is asserted LOW. The address presented to the address inputs is loaded into the address register. The write signals are latched into the control logic block.

On the subsequent clock rise the data lines are automatically tristated regardless of the state of the $\overline{OE}$ input signal. This allows the external logic to present the data on DQ and DQP ($DQ_{a,b,c,d,e,f,g,h}$/$DQP_{a,b,c,d,e,f,g,h}$ for CY7C1474V33,

DQ$_{a,b,c,d}$/DQP$_{a,b,c,d}$ for CY7C1470V33 and DQ$_{a,b}$/DQP$_{a,b}$ for CY7C1472V33). In addition, the address for the subsequent access (read/write/deselect) is latched into the address register (provided the appropriate control signals are asserted).

On the next clock rise the data presented to DQ and DQP (DQ$_{a,b,c,d,e,f,g,h}$/DQP$_{a,b,c,d,e,f,g,h}$ for CY7C1474V33, DQ$_{a,b,c,d}$/DQP$_{a,b,c,d}$ for CY7C1470V33 and DQ$_{a,b}$/DQP$_{a,b}$ for CY7C1472V33) (or a subset for byte write operations, see Write Cycle Description table for details) inputs is latched into the device and the write is complete.

The data written during the write operation is controlled by $\overline{BW}$ ($\overline{BW}_{a,b,c,d,e,f,g,h}$ for CY7C1474V33, $\overline{BW}_{a,b,c,d}$ for CY7C1470V33 and $\overline{BW}_{a,b}$ for CY7C1472V33) signals. The CY7C1470V33, CY7C1472V33, and CY7C1474V33 provides byte write capability that is described in the Write Cycle Description table. Asserting the write enable input ($\overline{WE}$) with the selected byte write select ($\overline{BW}$) input will selectively write to only the desired bytes. Bytes not selected during a byte write operation will remain unaltered. A synchronous self timed Write mechanism has been provided to simplify the write operations. Byte write capability has been included in order to greatly simplify read/modify/write sequences, which can be reduced to simple byte write operations.

Because the CY7C1470V33, CY7C1472V33, and CY7C1474V33 are common I/O devices, data should not be driven into the device while the outputs are active. The output enable ($\overline{OE}$) can be deasserted HIGH before presenting data to the DQ and DQP (DQ$_{a,b,c,d,e,f,g,h}$/DQP$_{a,b,c,d,e,f,g,h}$ for CY7C1474V33, DQ$_{a,b,c,d}$/DQP$_{a,b,c,d}$ for CY7C1470V33 and DQ$_{a,b}$/DQP$_{a,b}$ for CY7C1472V33) inputs. Doing so will tristate the output drivers. As a safety precaution, DQ and DQP (DQ$_{a,b,c,d,e,f,g,h}$/DQP$_{a,b,c,d,e,f,g,h}$ for CY7C1474V33, DQ$_{a,b,c,d}$/DQP$_{a,b,c,d}$ for CY7C1470V33 and DQ$_{a,b}$/DQP$_{a,b}$ for CY7C1472V33) are automatically tristated during the data portion of a write cycle, regardless of the state of $\overline{OE}$.

Burst Write Accesses

The CY7C1470V33, CY7C1472V33, and CY7C1474V33 has an on-chip burst counter that allows the user the ability to supply a single address and conduct up to four write operations without reasserting the address inputs. ADV/$\overline{LD}$ must be driven LOW in order to load the initial address, as described in the Single Write Accesses section above. When ADV/$\overline{LD}$ is driven HIGH on the subsequent clock rise, the chip enables ($\overline{CE}_1$, CE$_2$, and $\overline{CE}_3$)

and $\overline{WE}$ inputs are ignored and the burst counter is incremented. The correct BW ($\overline{BW}_{a,b,c,d,e,f,g,h}$ for CY7C1474V33, $\overline{BW}_{a,b,c,d}$ for CY7C1470V33 and $\overline{BW}_{a,b}$ for CY7C1472V33) inputs must be driven in each cycle of the burst write in order to write the correct bytes of data.

Sleep Mode

The ZZ input pin is an asynchronous input. Asserting ZZ places the SRAM in a power conservation "sleep" mode. Two clock cycles are required to enter into or exit from this "sleep" mode. While in this mode, data integrity is guaranteed. Accesses pending when entering the "sleep" mode are not considered valid nor is the completion of the operation guaranteed. The device must be deselected prior to entering the "sleep" mode. $\overline{CE}_1$, CE$_2$, and $\overline{CE}_3$, must remain inactive for the duration of t$_{ZZREC}$ after the ZZ input returns LOW.

Truth Table

The Truth Table for parts CY7C1470V33/CY7C1472V33/CY7C1474V33 is as follows. [1, 2, 3, 4, 5, 6, 7]

Operation	Address Used	$\overline{CE}$	ZZ	$\overline{ADV/LD}$	$\overline{WE}$	$\overline{BW}_x$	$\overline{OE}$	$\overline{CEN}$	CLK	DQ
Deselect cycle	None	H	L	L	X	X	X	L	L–H	Tri-state
Continue deselect cycle	None	X	L	H	X	X	X	L	L–H	Tri-state
Read cycle (begin burst)	External	L	L	L	H	X	L	L	L–H	Data out (Q)
Read cycle (continue burst)	Next	X	L	H	X	X	L	L	L–H	Data out (Q)
NOP/dummy read (begin burst)	External	L	L	L	H	X	H	L	L–H	Tri-state
Dummy read (continue burst)	Next	X	L	H	X	X	H	L	L–H	Tri-state
Write cycle (begin burst)	External	L	L	L	L	L	X	L	L–H	Data in (D)
Write cycle (continue burst)	Next	X	L	H	X	L	X	L	L–H	Data in (D)
NOP/write abort (begin burst)	None	L	L	L	L	H	X	L	L–H	Tri-state
Write abort (continue burst)	Next	X	L	H	X	H	X	L	L–H	Tri-state
Ignore clock edge (stall)	Current	X	L	X	X	X	X	H	L–H	–
Sleep mode	None	X	H	X	X	X	X	X	X	Tri-state

Notes
1. X = "Don't Care", H = Logic HIGH, L = Logic LOW, $\overline{CE}$ stands for all chip enables active. $\overline{BW}x$ = 0 signifies at least one byte write select is active, $\overline{BW}x$ = valid signifies that the desired byte write selects are asserted, see Write Cycle Description table for details.
2. Write is defined by $\overline{WE}$ and $\overline{BW}_{[a:d]}$. See Write Cycle Description table for details.
3. When a write cycle is detected, all I/Os are tristated, even during byte writes.
4. The DQ and DQP pins are controlled by the current cycle and the $\overline{OE}$ signal.
5. $\overline{CEN}$ = H inserts wait states.
6. Device will power-up deselected and the I/Os in a tristate condition, regardless of $\overline{OE}$.
7. $\overline{OE}$ is asynchronous and is not sampled with the clock rise. It is masked internally during Write cycles. During a Read cycle DQ_s and $DQP_{[a:d]}$ = tristate when $\overline{OE}$ is inactive or when the device is deselected, and DQ_s= data when $\overline{OE}$ is active.

Partial Write Cycle Description

The partial write cycle description for part CY7C1470V33 is as follows. [8, 9, 10, 11]

Function (CY7C1470V33)	$\overline{WE}$	$\overline{BW_d}$	$\overline{BW_c}$	$\overline{BW_b}$	$\overline{BW_a}$
Read	H	X	X	X	X
Write – no bytes written	L	H	H	H	H
Write byte a – (DQ$_a$ and DQP$_a$)	L	H	H	H	L
Write byte b – (DQ$_b$ and DQP$_b$)	L	H	H	L	H
Write bytes b, a	L	H	H	L	L
Write byte c – (DQ$_c$ and DQP$_c$)	L	H	L	H	H
Write bytes c, a	L	H	L	H	L
Write bytes c, b	L	H	L	L	H
Write bytes c, b, a	L	H	L	L	L
Write byte d – (DQ$_d$ and DQP$_d$)	L	L	H	H	H
Write bytes d, a	L	L	H	H	L
Write bytes d, b	L	L	H	L	H
Write bytes d, b, a	L	L	H	L	L
Write bytes d, c	L	L	L	H	H
Write bytes d, c, a	L	L	L	H	L
Write bytes d, c, b	L	L	L	L	H
Write all bytes	L	L	L	L	L

Partial Write Cycle Description

The partial write cycle description for part CY7C1472V33 is as follows. [8, 9, 10, 11]

Function (CY7C1472V33)	$\overline{WE}$	$\overline{BW_b}$	$\overline{BW_a}$
Read	H	x	x
Write – no bytes written	L	H	H
Write byte a – (DQ$_a$ and DQP$_a$)	L	H	L
Write byte b – (DQ$_b$ and DQP$_b$)	L	L	H
Write both bytes	L	L	L

Notes
8. X = "Don't Care", H = Logic HIGH, L = Logic LOW, $\overline{CE}$ stands for all chip enables active. $\overline{BW}$x = 0 signifies at least one byte write select is active, $\overline{BW}$x = valid signifies that the desired byte write selects are asserted, see Write Cycle Description table for details.
9. Write is defined by $\overline{WE}$ and $\overline{BW}_{[a:d]}$. See Write Cycle Description table for details.
10. When a write cycle is detected, all I/Os are tristated, even during byte writes.
11. Table only lists a partial listing of the Byte Write combinations. Any combination of $\overline{BW}_{[a:d]}$ is valid. Appropriate write will be done based on which Byte Write is active.

Partial Write Cycle Description

The partial write cycle description for part CY7C1474V33 is as follows. [12, 13, 14, 15]

Function (CY7C1474V33)	$\overline{WE}$	$\overline{BW_X}$
Read	H	x
Write – no bytes written	L	H
Write byte X – (DQ_X and $DQP_{X)}$	L	L
Write all bytes	L	All $\overline{BW}$ = L

Notes
12. X = "Don't Care", H = Logic HIGH, L = Logic LOW, $\overline{CE}$ stands for all chip enables active. $\overline{BW}x$ = 0 signifies at least one byte write select is active, $\overline{BW}x$ = valid signifies that the desired byte write selects are asserted, see Write Cycle Description table for details.
13. Write is defined by $\overline{WE}$ and $\overline{BW}_{[a:d]}$. See Write Cycle Description table for details.
14. When a write cycle is detected, all I/Os are tristated, even during byte writes.
15. Table only lists a partial listing of the Byte Write combinations. Any combination of $\overline{BW}_{[a:d]}$ is valid. Appropriate write will be done based on which Byte Write is active.

IEEE 1149.1 Serial Boundary Scan (JTAG)

The CY7C1470V33, and CY7C1474V33 incorporates a serial boundary scan test access port (TAP). This port operates in accordance with IEEE Standard 1149.1-1990 but does not have the set of functions required for full 1149.1 compliance. These functions from the IEEE specification are excluded because their inclusion places an added delay in the critical speed path of the SRAM. Note that the TAP controller functions in a manner that does not conflict with the operation of other devices using 1149.1 fully compliant TAPs. The TAP operates using JEDEC-standard 3.3 V or 2.5 V I/O logic levels.

The CY7C1470V33, and CY7C1474V33 contains a TAP controller, instruction register, boundary scan register, bypass register, and ID register.

Disabling the JTAG Feature

It is possible to operate the SRAM without using the JTAG feature. To disable the TAP controller, TCK must be tied LOW (V_{SS}) to prevent clocking of the device. TDI and TMS are internally pulled up and may be unconnected. They may alternately be connected to V_{DD} through a pull up resistor. TDO should be left unconnected. Upon power-up, the device will come up in a reset state which will not interfere with the operation of the device.

Test Access Port (TAP)

Test Clock (TCK)

The test clock is used only with the TAP controller. All inputs are captured on the rising edge of TCK. All outputs are driven from the falling edge of TCK.

Test Mode Select (TMS)

The TMS input is used to give commands to the TAP controller and is sampled on the rising edge of TCK. It is allowable to leave this ball unconnected if the TAP is not used. The ball is pulled up internally, resulting in a logic HIGH level.

Test Data-In (TDI)

The TDI ball is used to serially input information into the registers and can be connected to the input of any of the registers. The register between TDI and TDO is chosen by the instruction that is loaded into the TAP instruction register. For information on loading the instruction register, see the TAP Controller State Diagram on page 16. TDI is internally pulled up and can be unconnected if the TAP is unused in an application. TDI is connected to the most significant bit (MSB) of any register.

Test Data-Out (TDO)

The TDO output ball is used to serially clock data-out from the registers. The output is active depending upon the current state of the TAP state machine (see Identification Codes on page 20). The output changes on the falling edge of TCK. TDO is connected to the least significant bit (LSB) of any register.

Performing a TAP Reset

A RESET is performed by forcing TMS HIGH (V_{DD}) for five rising edges of TCK. This RESET does not affect the operation of the SRAM and may be performed while the SRAM is operating.

At power-up, the TAP is reset internally to ensure that TDO comes up in a high Z state.

TAP Registers

Registers are connected between the TDI and TDO balls and allow data to be scanned into and out of the SRAM test circuitry. Only one register can be selected at a time through the instruction register. Data is serially loaded into the TDI ball on the rising edge of TCK. Data is output on the TDO ball on the falling edge of TCK.

Instruction Register

Three bit instructions can be serially loaded into the instruction register. This register is loaded when it is placed between the TDI and TDO balls as shown in the TAP Controller Block Diagram on page 17. Upon power-up, the instruction register is loaded with the IDCODE instruction. It is also loaded with the IDCODE instruction if the controller is placed in a reset state as described in the previous section.

When the TAP controller is in the Capture-IR state, the two least significant bits are loaded with a binary "01" pattern to allow for fault isolation of the board-level serial test data path.

Bypass Register

To save time when serially shifting data through registers, it is sometimes advantageous to skip certain chips. The bypass register is a single bit register that can be placed between the TDI and TDO balls. This allows data to be shifted through the SRAM with minimal delay. The bypass register is set LOW (V_{SS}) when the BYPASS instruction is executed.

Boundary Scan Register

The boundary scan register is connected to all the input and bidirectional balls on the SRAM.

The boundary scan register is loaded with the contents of the RAM I/O ring when the TAP controller is in the Capture-DR state and is then placed between the TDI and TDO balls when the controller is moved to the Shift-DR state. The EXTEST, SAMPLE/PRELOAD and SAMPLE Z instructions can be used to capture the contents of the I/O ring.

The Boundary Scan Exit Order on page 21 and Boundary Scan Exit Order on page 22 show the order in which the bits are connected. Each bit corresponds to one of the bumps on the SRAM package. The MSB of the register is connected to TDI and the LSB is connected to TDO.

Identification (ID) Register

The ID register is loaded with a vendor-specific, 32-bit code during the Capture-DR state when the IDCODE command is loaded in the instruction register. The IDCODE is hardwired into the SRAM and can be shifted out when the TAP controller is in the Shift-DR state. The ID register has a vendor code and other information described in the Identification Register Definitions table.

TAP Instruction Set

Overview

Eight different instructions are possible with the three bit instruction register. All combinations are listed in Identification

Codes on page 20. Three of these instructions are listed as RESERVED and should not be used. The other five instructions are described in detail below.

The TAP controller used in this SRAM is not fully compliant to the 1149.1 convention because some of the mandatory 1149.1 instructions are not fully implemented.

The TAP controller cannot be used to load address data or control signals into the SRAM and cannot preload the I/O buffers. The SRAM does not implement the 1149.1 commands EXTEST or INTEST or the PRELOAD portion of SAMPLE/PRELOAD; rather, it performs a capture of the I/O ring when these instructions are executed.

Instructions are loaded into the TAP controller during the Shift-IR state when the instruction register is placed between TDI and TDO. During this state, instructions are shifted through the instruction register through the TDI and TDO balls. To execute the instruction after it is shifted in, the TAP controller needs to be moved into the Update-IR state.

EXTEST

EXTEST is a mandatory 1149.1 instruction which is to be executed whenever the instruction register is loaded with all 0s. EXTEST is not implemented in this SRAM TAP controller, and therefore this device is not compliant to 1149.1. The TAP controller does recognize an all-0 instruction.

When an EXTEST instruction is loaded into the instruction register, the SRAM responds as if a SAMPLE/PRELOAD instruction has been loaded. There is one difference between the two instructions. Unlike the SAMPLE/PRELOAD instruction, EXTEST places the SRAM outputs in a high Z state.

IDCODE

The IDCODE instruction causes a vendor-specific, 32-bit code to be loaded into the instruction register. It also places the instruction register between the TDI and TDO balls and allows the IDCODE to be shifted out of the device when the TAP controller enters the Shift-DR state.

The IDCODE instruction is loaded into the instruction register upon power up or whenever the TAP controller is given a test logic reset state.

SAMPLE Z

The SAMPLE Z instruction causes the boundary scan register to be connected between the TDI and TDO balls when the TAP controller is in a Shift-DR state. It also places all SRAM outputs into a high Z state.

SAMPLE/PRELOAD

SAMPLE/PRELOAD is a 1149.1 mandatory instruction. The PRELOAD portion of this instruction is not implemented, so the device TAP controller is not fully 1149.1 compliant.

When the SAMPLE/PRELOAD instruction is loaded into the instruction register and the TAP controller is in the Capture-DR state, a snapshot of data on the inputs and bidirectional balls is captured in the boundary scan register.

The user must be aware that the TAP controller clock can only operate at a frequency up to 20 MHz, while the SRAM clock operates more than an order of magnitude faster. Because there is a large difference in the clock frequencies, it is possible that during the Capture-DR state, an input or output will undergo a transition. The TAP may then try to capture a signal while in transition (metastable state). This will not harm the device, but there is no guarantee as to the value that will be captured. Repeatable results may not be possible.

To guarantee that the boundary scan register will capture the correct value of a signal, the SRAM signal must be stabilized long enough to meet the TAP controller's capture setup plus hold time (t_{CS} plus t_{CH}).

The SRAM clock input might not be captured correctly if there is no way in a design to stop (or slow) the clock during a SAMPLE/PRELOAD instruction. If this is an issue, it is still possible to capture all other signals and simply ignore the value of the CLK captured in the boundary scan register.

After the data is captured, it is possible to shift out the data by putting the TAP into the Shift-DR state. This places the boundary scan register between the TDI and TDO balls.

Note that since the PRELOAD part of the command is not implemented, putting the TAP to the Update-DR state while performing a SAMPLE/PRELOAD instruction will have the same effect as the Pause-DR command.

BYPASS

When the BYPASS instruction is loaded in the instruction register and the TAP is placed in a Shift-DR state, the bypass register is placed between the TDI and TDO balls. The advantage of the BYPASS instruction is that it shortens the boundary scan path when multiple devices are connected together on a board.
Reserved

These instructions are not implemented but are reserved for future use. Do not use these instructions.
TAP Controller State Diagram
The 0/1 next to each state represents the value of TMS at the rising edge of TCK.

Identification Register Definitions

Instruction Field	CY7C1470V33 (2 M × 36)	CY7C1474V33 (1 M × 72)	Description
Revision number (31:29)	000	000	Describes the version number
Device depth (28:24) [19]	01011	01011	Reserved for internal use
Architecture/memory type (23:18)	001000	001000	Defines memory type and architecture
Bus width/density (17:12)	100100	110100	Defines width and density
Cypress JEDEC ID code (11:1)	00000110100	00000110100	Allows unique identification of SRAM vendor
ID register presence indicator (0)	1	1	Indicates the presence of an ID register

Scan Register Sizes

Register Name	Bit Size (× 36)	Bit Size (× 72)
Instruction	3	3
Bypass	1	1
ID	32	32
Boundary scan order – 165-ball FBGA	71	–
Boundary scan order – 209-ball FBGA	–	110

Identification Codes

Instruction	Code	Description
EXTEST	000	Captures I/O ring contents. Places the boundary scan register between TDI and TDO. Forces all SRAM outputs to high Z state. This instruction is not 1149.1 compliant.
IDCODE	001	Loads the ID register with the vendor ID code and places the register between TDI and TDO. This operation does not affect SRAM operations.
SAMPLE Z	010	Captures I/O ring contents. Places the boundary scan register between TDI and TDO. Forces all SRAM output drivers to a high Z state.
RESERVED	011	Do Not Use: This instruction is reserved for future use.
SAMPLE/PRELOAD	100	Captures I/O ring contents. Places the boundary scan register between TDI and TDO. Does not affect SRAM operation. This instruction does not implement 1149.1 preload function and is therefore not 1149.1 compliant.
RESERVED	101	Do Not Use: This instruction is reserved for future use.

Note
19. Bit #24 is "1" in the ID Register Definitions for both 2.5 V and 3.3 V versions of this device.

Electrical Characteristics

Over the Operating Range

Parameter [20, 21]	Description	Test Conditions	Min	Max	Unit
V_{DD}	Power supply voltage		3.135	3.6	V
V_{DDQ}	I/O supply voltage	for 3.3 V I/O	3.135	V_{DD}	V
		for 2.5 V I/O	2.375	2.625	V
V_{OH}	Output HIGH voltage	for 3.3 V I/O, I_{OH} = –4.0 mA	2.4	–	V
		for 2.5 V I/O, I_{OH} = –1.0 mA	2.0	–	V
V_{OL}	Output LOW voltage	for 3.3 V I/O, I_{OL} = 8.0 mA	–	0.4	V
		for 2.5 V I/O, I_{OL} = 1.0 mA	–	0.4	V
V_{IH}	Input HIGH voltage [20]	for 3.3 V I/O	2.0	V_{DD} + 0.3	V
		for 2.5 V I/O	1.7	V_{DD} + 0.3	V
V_{IL}	Input LOW voltage [20]	for 3.3 V I/O	–0.3	0.8	V
		for 2.5 V I/O	–0.3	0.7	V
I_X	Input leakage current except ZZ and MODE	GND ≤ V_I ≤ V_{DDQ}	–5	5	μA
	Input current of MODE	Input = V_{SS}	–30	–	μA
		Input = V_{DD}	–	5	μA
	Input current of ZZ	Input = V_{SS}	–5	–	μA
		Input = V_{DD}	–	30	μA
I_{OZ}	Output leakage current	GND ≤ V_I ≤ V_{DDQ}, output disabled	–5	5	μA

Notes
20. Overshoot: $V_{IH(AC)}$ < V_{DD} +1.5 V (Pulse width less than t_{CYC}/2), undershoot: $V_{IL(AC)}$ > –2 V (Pulse width less than t_{CYC}/2).
21. $T_{power up}$: Assumes a linear ramp from 0 V to $V_{DD(Min)}$ within 200 ms. During this time V_{IH} < V_{DD} and V_{DDQ} ≤ V_{DD}.

Electrical Characteristics *(continued)*

Over the Operating Range

Parameter [20, 21]	Description	Test Conditions		Min	Max	Unit
I_{DD}	V_{DD} operating supply	V_{DD} = Max, I_{OUT} = 0 mA, f = f_{MAX} = 1/t_{CYC}	5.0 ns cycle, 200 MHz	–	500	mA
			6.0 ns cycle, 167 MHz	–	450	mA
I_{SB1}	Automatic CE power-down current – TTL inputs	Max V_{DD}, device deselected, $V_{IN} \geq V_{IH}$ or $V_{IN} \leq V_{IL}$, f = f_{MAX} = 1/t_{CYC}	5.0 ns cycle, 200 MHz	–	245	mA
			6.0 ns cycle, 167 MHz	–	245	mA
I_{SB2}	Automatic CE power-down current – CMOS inputs	Max V_{DD}, device deselected, $V_{IN} \leq 0.3$ V or $V_{IN} \geq V_{DDQ} - 0.3$ V, f = 0	All speed grades	–	120	mA
I_{SB3}	Automatic CE power-down current – CMOS inputs	Max V_{DD}, device deselected, $V_{IN} \leq 0.3$ V or $V_{IN} \geq V_{DDQ} - 0.3$ V, f = f_{MAX} = 1/t_{CYC}	5.0 ns cycle, 200 MHz	–	245	mA
			6.0 ns cycle, 167 MHz	–	245	mA
I_{SB4}	Automatic CE power-down current – TTL inputs	Max V_{DD}, device deselected, $V_{IN} \geq V_{IH}$ or $V_{IN} \leq V_{IL}$, f = 0	All speed grades	–	135	mA

Capacitance

Parameter [22]	Description	Test Conditions	100-pin TQFP Max	165-ball FBGA Max	209-ball FBGA Max	Unit
$C_{ADDRESS}$	Address input capacitance	T_A = 25 °C, f = 1 MHz, V_{DD} = 3.3 V, V_{DDQ} = 2.5 V	6	6	6	pF
C_{DATA}	Data input capacitance		5	5	5	pF
C_{CTRL}	Control input capacitance		8	8	8	pF
C_{CLK}	Clock input capacitance		6	6	6	pF
$C_{I/O}$	Input/output capacitance		5	5	5	pF

Thermal Resistance

Parameter [22]	Description	Test Conditions	100-pin TQFP Package	165-ball FBGA Package	209-ball FBGA Package	Unit
Θ_{JA}	Thermal resistance (junction to ambient)	Test conditions follow standard test methods and procedures for measuring thermal impedance, per EIA/JESD51.	24.63	16.3	15.2	°C/W
Θ_{JC}	Thermal resistance (junction to case)		2.28	2.1	1.7	°C/W

Note
22. Tested initially and after any design or process changes that may affect these parameters.

Switching Characteristics

Over the Operating Range

Parameter [23, 24]	Description	-200		-167		Unit
		Min	Max	Min	Max	
t_{Power} [25]	$V_{CC(typical)}$ to the first access read or write	1	–	1	–	ms
Clock						
t_{CYC}	Clock cycle time	5.0	–	6.0	–	ns
F_{MAX}	Maximum operating frequency	–	200	–	167	MHz
t_{CH}	Clock HIGH	2.0	–	2.2	–	ns
t_{CL}	Clock LOW	2.0	–	2.2	–	ns
Output Times						
t_{CO}	Data output valid after CLK rise	–	3.0	–	3.4	ns
t_{OEV}	$\overline{OE}$ LOW to output valid	–	3.0	–	3.4	ns
t_{DOH}	Data output hold after CLK rise	1.3	–	1.5	–	ns
t_{CHZ}	Clock to high Z [26, 27, 28]	–	3.0	–	3.4	ns
t_{CLZ}	Clock to low Z [26, 27, 28]	1.3	–	1.5	–	ns
t_{EOHZ}	$\overline{OE}$ HIGH to output high Z [26, 27, 28]	–	3.0	–	3.4	ns
t_{EOLZ}	$\overline{OE}$ LOW to output low Z [26, 27, 28]	0	–	0	–	ns
Setup Times						
t_{AS}	Address setup before CLK rise	1.4	–	1.5	–	ns
t_{DS}	Data input setup before CLK rise	1.4	–	1.5	–	ns
t_{CENS}	$\overline{CEN}$ setup before CLK rise	1.4	–	1.5	–	ns
t_{WES}	$\overline{WE}$, $\overline{BW}_x$ setup before CLK rise	1.4	–	1.5	–	ns
t_{ALS}	ADV/$\overline{LD}$ setup before CLK rise	1.4	–	1.5	–	ns
t_{CES}	Chip select setup	1.4	–	1.5	–	ns
Hold Times						
t_{AH}	Address hold after CLK rise	0.4	–	0.5	–	ns
t_{DH}	Data input hold after CLK rise	0.4	–	0.5	–	ns
t_{CENH}	$\overline{CEN}$ hold after CLK rise	0.4	–	0.5	–	ns
t_{WEH}	$\overline{WE}$, $\overline{BW}_x$ hold after CLK rise	0.4	–	0.5	–	ns
t_{ALH}	ADV/$\overline{LD}$ hold after CLK rise	0.4	–	0.5	–	ns
t_{CEH}	Chip select hold after CLK rise	0.4	–	0.5	–	ns

Notes
23. Timing reference is 1.5 V when V_{DDQ} = 3.3 V and is 1.25 V when V_{DDQ} = 2.5 V.
24. Test conditions shown in (a) of Figure 4 on page 25 unless otherwise noted.
25. This part has a voltage regulator internally; t_{power} is the time power needs to be supplied above $V_{DD(minimum)}$ initially, before a read or write operation can be initiated.
26. t_{CHZ}, t_{CLZ}, t_{EOLZ}, and t_{EOHZ} are specified with AC test conditions shown in (b) of Figure 4 on page 25. Transition is measured ±200 mV from steady-state voltage.
27. At any voltage and temperature, t_{EOHZ} is less than t_{EOLZ} and t_{CHZ} is less than t_{CLZ} to eliminate bus contention between SRAMs when sharing the same data bus. These specifications do not imply a bus contention condition, but reflect parameters guaranteed over worst case user conditions. Device is designed to achieve high Z prior to low Z under the same system conditions.
28. This parameter is sampled and not 100% tested.

Switching Waveforms

Figure 5. Read/Write/Timing [29, 30, 31]
Notes
29. For this waveform ZZ is tied LOW.
30. When $\overline{CE}$ is LOW, $\overline{CE}_1$ is LOW, CE_2 is HIGH and $\overline{CE}_3$ is LOW. When $\overline{CE}$ is HIGH, $\overline{CE}_1$ is HIGH or CE_2 is LOW or $\overline{CE}_3$ is HIGH.
31. Order of the burst sequence is determined by the status of the MODE (0 = Linear, 1= Interleaved). Burst operations are optional.

Switching Waveforms (continued)

Figure 6. NOP, STALL and DESELECT Cycles [32, 33, 34]

	WRITE D(A1)	READ Q(A2)	STALL	READ Q(A3)	WRITE D(A4)	STALL	NOP	READ Q(A5)	DESELECT	CONTINUE DESELECT

DON'T CARE   UNDEFINED
Figure 7. ZZ Mode Timing [35, 36]

DON'T CARE
Notes
32. For this waveform ZZ is tied LOW.
33. When $\overline{CE}$ is LOW, $\overline{CE_1}$ is LOW, CE_2 is HIGH and $\overline{CE_3}$ is LOW. When $\overline{CE}$ is HIGH, $\overline{CE_1}$ is HIGH or CE_2 is LOW or $\overline{CE_3}$ is HIGH.
34. The IGNORE CLOCK EDGE or STALL cycle (Clock 3) illustrated $\overline{CEN}$ being used to create a pause. A write is not performed during this cycle.
35. Device must be deselected when entering ZZ mode. See cycle description table for all possible signal conditions to deselect the device.
36. I/Os are in high Z when exiting ZZ sleep mode.

Ordering Information

The table below contains only the parts that are currently available. If you don't see what you are looking for, please contact your local sales representative. Document Title: CY7C1470V33/CY7C1472V33/CY7C1474V33, 72-Mbit (2 M × 36/4 M × 18/1 M × 72) Pipelined SRAM with NoBL™ Architecture
Document Number: 38-05289

Rev.	ECN	Submission Date	Orig. of Change	Description of Change
**	114676	08/06/02	PKS	New data sheet.
*A	121520	01/27/03	CJM	Changed status from Advanced Information to Preliminary. Updated Features (For package offering, removed 300 MHz frequency related information). Updated Selection Guide (Removed 300 MHz frequency related information). Updated Functional Overview (Removed 300 MHz frequency related information). Updated Electrical Characteristics (Removed 300 MHz frequency related information). Updated Switching Characteristics (Removed 300 MHz frequency related information, changed maximum value of t_{CO}, t_{EOV}, t_{CHZ}, t_{EOHZ} parameters from 2.4 ns to 2.6 ns for 250 MHz frequency, changed minimum value of t_{DOH}, t_{CLZ} parameters from 0.8 ns to 1.0 ns for 250 MHz frequency, changed minimum value of t_{DOH}, t_{CLZ} parameters from 1.0 ns to 1.3 ns for 200 MHz frequency). Updated Ordering Information (Updated part numbers).
*B	223721	See ECN	NJY	Updated Features (Removed 250 MHz frequency related information and included 225 MHz frequency related information). Updated Functional Description (description). Updated Logic Block Diagram (Splitted Logic Block Diagram into three Logic Block Diagrams). Updated Functional Overview (description). Updated Boundary Scan Exit Order (Replaced TBD with values for all packages). Updated Electrical Characteristics (Removed 250 MHz frequency related information and included 225 MHz frequency related information, replaced TBD with values for maximum values of I_{DD}, I_{SB1}, I_{SB2}, I_{SB3}, I_{SB4} parameters). Updated Capacitance (Replaced TBD with values for all packages). Updated Thermal Resistance (Replaced TBD with values for all packages). Updated Switching Characteristics (Removed 250 MHz frequency related information and included 225 MHz frequency related information). Updated Switching Waveforms. Updated Package Diagrams (spec 51-85165 (Changed revision from ** to *A) for 165-ball FBGA package, removed 119-ball BGA package (spec 51-85115), removed spec 51-85143 and incluued spec 51-85167 for 209-ball BGA package).
*C	235012	See ECN	RYQ	Minor Change (To match on the spec system and external web).
*D	243572	See ECN	NJY	Updated Pin Configurations (Updated Figure 2 (Changed ball C11, D11, E11, F11, G11 from DQP_b, DQ_b, DQ_b, DQ_b, DQ_b to DQP_a, DQ_a, DQ_a, DQ_a, DQ_a (corresponding to CY7C1472V33))). Updated Capacitance (Splitted C_{IN} parameter into $C_{ADDRESS}$, C_{DATA}, C_{CLK} parameters and also updated the values).

Document History Page *(continued)*

Document Title: CY7C1470V33/CY7C1472V33/CY7C1474V33, 72-Mbit (2 M × 36/4 M × 18/1 M × 72) Pipelined SRAM with NoBL™ Architecture
Document Number: 38-05289

Rev.	ECN	Submission Date	Orig. of Change	Description of Change
*E	299511	See ECN	SYT / VBL	Updated Features (Removed 225 MHz frequency related information and included 250 MHz frequency related information). Updated Selection Guide (Removed 225 MHz frequency related information and included 250 MHz frequency related information). Updated Electrical Characteristics (Removed 225 MHz frequency related information and included 250 MHz frequency related information). Updated Thermal Resistance (Changed value of Θ_{JA} from 16.8 °C/W to 24.63 °C/W, and changed value of Θ_{JC} from 3.3 °C/W to 2.28 °C/W for 100-pin TQFP Package). Updated Switching Characteristics (Removed 225 MHz frequency related information and included 250 MHz frequency related information, changed minimum value of t_{CYC} from 4.4 ns to 4.0 ns for 250 MHz frequency). Updated Ordering Information (Updated part numbers (Removed 225 MHz frequency related information and included 250 MHz frequency related information, added Pb-free information for 100-pin TQFP Package and 165-ball FBGA Package, added Industrial Temperature Range part numbers), added comment of 'Pb-free BG packages availability' below the Ordering Information).
*F	323039	See ECN	PCI	Changed status from Preliminary to Final. Updated Selection Guide (Unshaded 250 MHz frequency related information). Updated Pin Configurations (Address expansion pins/balls in the pinouts for all packages are modified as per JEDEC standard, updated Figure 3 (Changed package name from 209-ball PBGA to 209-ball FBGA)). Updated Pin Definitions (Added Address Expansion pins). Updated Electrical Characteristics (Updated Test Conditions of V_{OL}, V_{OH} parameters, unshaded 250 MHz frequency related information). Updated Switching Characteristics (Unshaded 250 MHz frequency related information). Updated Ordering Information (Updated part numbers, unshaded all shaded areas, removed comment of 'Pb-free BG packages availability' below the Ordering Information).
*G	351937	See ECN	PCI	Updated Ordering Information (Updated part numbers).
*H	416221	See ECN	RXU	Changed address of Cypress Semiconductor Corporation from "3901 North First Street" to "198 Champion Court". Updated Electrical Characteristics (Updated Note 21 (Changed $V_{DDQ} < V_{DD}$ to $V_{DDQ} \leq V_{DD}$), changed description of I_X parameter from Input Load Current except ZZ and MODE to Input Leakage Current except ZZ and MODE, changed minimum value of I_X parameter (corresponding to Input Current of MODE (Input = V_{SS})) from –5 µA to –30 µA, changed maximum value of I_X parameter (corresponding to Input Current of MODE (Input = V_{DD})) from 30 µA to 5 µA, changed minimum value of I_X parameter (corresponding to Input Current of ZZ (Input = V_{SS})) from –30 µA to –5 µA, changed maximum value of I_X parameter (corresponding to Input Current of ZZ (Input = V_{DD})) from 5 µA to 30 µA). Updated Ordering Information (Updated part numbers, replaced Package Name column with Package Diagram in the Ordering Information table). Replaced Three-state with Tri-state in all instances across the document.

Document History Page *(continued)*

Document Title: CY7C1470V33/CY7C1472V33/CY7C1474V33, 72-Mbit (2 M × 36/4 M × 18/1 M × 72) Pipelined SRAM with NoBL™ Architecture
Document Number: 38-05289

Rev.	ECN	Submission Date	Orig. of Change	Description of Change
*I	472335	See ECN	VKN	Updated Pin Configurations (Updated Figure 3 (Corrected the ball name for H9 from V_{SSQ} to V_{SS}). Updated TAP AC Switching Characteristics (Changed minimum value of t_{TH}, t_{TL} parameters from 25 ns to 20 ns, changed maximum value of t_{TDOV} parameter from 5 ns to 10 ns). Updated Maximum Ratings (Added Maximum Rating for Supply Voltage on V_{DDQ} Relative to GND). Updated Ordering Information (Updated part numbers).
*J	2756998	08/28/09	VKN	Added Neutron Soft Error Immunity. Updated Ordering Information (Updated part numbers (Including parts that are available), and modified the disclaimer for the Ordering information). Updated Package Diagrams (spec 51-85165 (Changed revision from *A to *B)).
*K	2903057	04/01/2010	NJY	Updated Ordering Information (Updated part numbers). Updated Package Diagrams.
*L	3033272	09/19/2010	NJY	Added Ordering Code Definitions. Added Acronyms and Units of Measure. Minor edits and updated in new template.
*M	3052882	10/08/2010	NJY	Updated Ordering Information (Removed obsolete parts).
*N	3357114	08/29/2011	PRIT	Updated Package Diagrams.
*O	3403584	10/12/2011	PRIT	Updated Ordering Information (Removed prune part number CY7C1472V33-167AXI). Updated Package Diagrams.
*P	3638614	06/06/2012	PRIT	Updated Features (Removed 250 MHz frequency related information, removed 165-ball FBGA package related information (corresponding to CY7C1472V33)). Updated Selection Guide (Removed 250 MHz frequency related information). Updated Pin Configurations (Updated Figure 2 (Removed CY7C1472V33 related information)). Updated Functional Overview (Removed 250 MHz frequency related information). Updated IEEE 1149.1 Serial Boundary Scan (JTAG) (Removed CY7C1472V33 related information). Updated Identification Register Definitions (Removed CY7C1472V33 related information). Updated Scan Register Sizes (Removed "Bit Size (× 18)" column). Removed Boundary Scan Exit Order (Corresponding to CY7C1472V33). Updated Electrical Characteristics (Removed 250 MHz frequency related information). Updated Switching Characteristics (Removed 250 MHz frequency related information). Updated Ordering Information (Updated part numbers).
*Q	3755966	09/26/2012	PRIT	Updated Package Diagrams (spec 51-85167 (Changed revision from *B to *C)).
