

**BMR465 Series PoL Regulators**  
 Input 7.5 - 14 V, Output up to 90 A / 162 W

28701 - BMR 465 Rev. D March 2016  
 © Ericsson AB

**Key Features**

- Small Package  
 Laydown: 50.8 x 19.05 x 10.0 mm (2.0 x 0.75 x 0.39 in)  
 SIP: 50.8 x 9.51 x 19.05 mm (2.0 x 0.37 x 0.75 in)
- Next generation Dynamic Loop Compensation (DLC)
- Non-linear charge mode control with fast load transient response.
- 0.6 V - 1.8 V output voltage range
- High maximum output current, 90 A
- Current sharing up to 4 modules, 360 A
- High efficiency, typ. 94.3% at 12 Vin, 1.8 Vout, half load
- Configuration and monitoring via PMBus
- Phase synchronization & spreading
- Voltage tracking capability
- Margining up/down to +/-10%
- MTBF 14.95 Mh

**General Characteristics**

- Configuration support via Ericsson Power Designer
- Monotonic soft-start ramp up
- Reduced external output decoupling capacitance
- Input under-voltage & over-voltage shutdown
- Output short-circuit & over voltage protection
- Over temperature protection
- Remote control & Power Good pins
- Differential sense pins
- Voltage setting via pin-strap or PMBus
- ISO 9001/14001 certified supplier
- Highly automated manufacturing ensures quality

**Safety Approvals**

**Design for Environment**

Meets requirements in high-temperature lead-free soldering processes.

Options	Description
n <sub>1</sub>	0 Horizontal through hole mounted version (Laydown TH) 1 Horizontal surface mounted version (Laydown SMD) 2 Vertical through hole mounted version (Single in Line, SIP)
n <sub>2</sub>	0 Open frame 1 Open frame, 5.5 mm pin length
n <sub>3</sub> n <sub>4</sub>	10 PMBus and pin strap
n <sub>5</sub> n <sub>6</sub> n <sub>7</sub>	001 CTRL pin positive logic (active high)
n <sub>8</sub>	B Antistatic tray of 144 products (SIP) C Antistatic tape & reel of 130 products (Laydown TH and SMD)

Example: Product number BMR 465 0010/001C equals a through-hole mounted, open frame, PMBus and analog pin strap, positive RC logic, standard configuration variant, package tape&reel.

**General Information**
**Reliability**

The failure rate ( $\lambda$ ) and mean time between failures (MTBF =  $1/\lambda$ ) is calculated at max output power and an operating ambient temperature ( $T_A$ ) of +40°C. Ericsson Power Modules uses Telcordia SR-332 Issue 2 Method 1 to calculate the mean steady-state failure rate and standard deviation ( $\sigma$ ).

Telcordia SR-332 Issue 3 also provides techniques to estimate the upper confidence levels of failure rates based on the mean and standard deviation.

Mean steady-state	Std. deviation, $\sigma$
67 nFailures/h	8.3 nFailures/h

MTBF (mean value) for the BMR465 series = 14.95 Mh.  
 MTBF at 90% confidence level = 12.89 Mh

**Compatibility with RoHS requirements**

The products are compatible with the relevant clauses and requirements of the RoHS directive 2011/65/EU and have a maximum concentration value of 0.1% by weight in homogeneous materials for lead, mercury, hexavalent chromium, PBB and PBDE and of 0.01% by weight in homogeneous materials for cadmium.

Exemptions in the RoHS directive utilized in Ericsson Power Modules products are found in the Statement of Compliance document.

Ericsson Power Modules fulfills and will continuously fulfill all its obligations under regulation (EC) No 1907/2006 concerning the registration, evaluation, authorization and restriction of chemicals (REACH) as they enter into force and is through product materials declarations preparing for the obligations to communicate information on substances in the products.

**Quality Statement**

The products are designed and manufactured in an industrial environment where quality systems and methods like ISO 9000, Six Sigma, and SPC are intensively in use to boost the continuous improvements strategy. Infant mortality or early failures in the products are screened out and they are subjected to an ATE-based final test. Conservative design rules, design reviews and product qualifications, plus the high competence of an engaged work force, contribute to the high quality of the products.

**Warranty**

Warranty period and conditions are defined in Ericsson Power Modules General Terms and Conditions of Sale.

**Limitation of Liability**

Ericsson Power Modules does not make any other warranties, expressed or implied including any warranty of merchantability or fitness for a particular purpose (including, but not limited to, use in life support applications, where malfunctions of product can cause injury to a person's health or life).

**© Ericsson AB 2016**

The information and specifications in this technical specification is believed to be correct at the time of publication. However, no liability is accepted for inaccuracies, printing errors or for any consequences thereof. Ericsson AB reserves the right to change the contents of this technical specification at any time without prior notice.

**Safety Specification****General information**

Ericsson Power Modules DC/DC converters and DC/DC regulators are designed in accordance with the safety standards IEC 60950-1, EN 60950-1 and UL 60950-1 *Safety of Information Technology Equipment*.

IEC/EN/UL 60950-1 contains requirements to prevent injury or damage due to the following hazards:

- Electrical shock
- Energy hazards
- Fire
- Mechanical and heat hazards
- Radiation hazards
- Chemical hazards

On-board DC/DC converters and DC/DC regulators are defined as component power supplies. As components they cannot fully comply with the provisions of any safety requirements without “conditions of acceptability”. Clearance between conductors and between conductive parts of the component power supply and conductors on the board in the final product must meet the applicable safety requirements. Certain conditions of acceptability apply for component power supplies with limited stand-off (see Mechanical Information and Safety Certificate for further information). It is the responsibility of the installer to ensure that the final product housing these components complies with the requirements of all applicable safety standards and regulations for the final product.

Component power supplies for general use should comply with the requirements in IEC/EN/UL 60950-1 *Safety of Information Technology Equipment*. Product related standards, e.g. IEEE 802.3af *Power over Ethernet*, and ETS-300132-2 *Power interface at the input to telecom equipment, operated by direct current (dc)* are based on IEC/EN/UL 60950-1 with regards to safety.

Ericsson Power Modules DC/DC converters, Power interface modules and DC/DC regulators are UL 60950-1 recognized and certified in accordance with EN 60950-1. The flammability rating for all construction parts of the products meet requirements for V-0 class material according to IEC 60695-11-10, *Fire hazard testing, test flames* – 50 W horizontal and vertical flame test methods.

**Non - isolated DC/DC regulators**

The DC/DC regulator output is SELV if the input source meets the requirements for SELV circuits according to IEC/EN/UL 60950-1.

Pin	Designation	Type	Function
1A, 1B, 1C, 1D	VIN	Power	Input Voltage
2A, 2B, 2C, 2D	GND	Power	Power Ground
3A, 3B, 3C, 3D	VOUT	Power	Output Voltage
4A	+S	I	Positive sense. Connect to output voltage close to the load.
4B	-S	I	Negative sense. Connect to power ground close to the load.
5A	VSET	I	Output voltage pin strap. Used with external resistor to set the nominal output voltage. See section Output Voltage Adjust using Pin-strap Resistor.
5B	VTRK	I	Voltage Tracking input. Allows for tracking of output voltage to an external voltage. See section Voltage Tracking.
6A	SALERT	O Open-Drain	PMBus Alert. Asserted low when any of the configured protection mechanisms indicate a fault or a warning. See section Monitoring Faults.
6B	SDA	I/O	PMBus Data. Data signal for PMBus communication. Requires a pull-up resistor even when unused. See section PMBus Interface.
7A	SCL	I/O	PMBus Clock. Clock for PMBus communication. Requires a pull-up resistor even when unused. See section PMBus Interface.
7B	FAULT	I/O	Fault Indicator. For standalone operation this pin is not used and shall be left unconnected. For parallel operation this pin shall be connected between products using 0 $\Omega$ resistors. See section Parallel Operation.
8A	SA	I	PMBus address pin strap. Used with external resistor to assign a unique PMBus address to the product. May be left open if PMBus is not used. See section PMBus Addressing.
8B	SYNC	I/O	External switching frequency synchronization input or output. May be left open if unused. See section Synchronization.
9A	PG	O Open-Drain	Power Good output. Asserted high when the product is ready to provide regulated output voltage to the load. See section Power Good.
9B	CTRL	I	Remote Control. Can be used to enable/disable the output voltage of the product. May be left open if unused due to internal pull-up. See section Remote Control.
10A	GCB	I/O	Group Communication Bus. Used for current sharing, and inter-device communication. See section Group Communication Bus.
10B	PREF	Power	Pin-strap reference. Ground reference for pin-strap resistors.
11, 12	NC	No Connect	Support pins. These pins are available only in lay down versions.

**Absolute Maximum Ratings**

Characteristics		min	typ	max	Unit
$T_{P1}$	Operating temperature (see Thermal Consideration section)	-40		150	°C
$T_S$	Storage temperature (Ambient)	-40		125	°C
$V_I$	Input voltage (See Operating Information Section for input and output voltage relations)	-0.3		16	V
Signal I/O voltage	CTRL, SA, SALERT, SCL, SDA, VSET, SYNC, PG, GCB, FAULT	-0.3		6	V
Ground voltage differential	-S, PREF, GND	-0.3		0.3	V
Analog pin voltage	$V_O$ , +S, VTRK	-0.3		6.5	V

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the Electrical Specification section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**Configuration File**

This product is designed with a digital control circuit. The control circuit uses a configuration file which determines the functionality and performance of the product. The Electrical Specification table shows parameter values of functionality and performance with the Standard configuration, unless otherwise specified. The Standard configuration is designed to fit most application needs. Changes in Standard configuration might be required to optimize performance in specific application. Note that current sharing operation requires changed configuration. See application note AN307 for further information.

**Common Electrical Specification**

This section includes parameter specifications common to all product versions within the product series. Typically these are parameters defined by the digital controller of the products. In the table below PMBus commands for configurable parameters are written in capital letters.

$T_{P1}$  = -30 to +95 °C,  $V_I$  = 7.5 to 14 V, unless otherwise specified under Conditions.

Typical values given at:  $T_{P1}$  = +25 °C,  $V_I$  = 12.0 V, max  $I_O$ , unless otherwise specified under Conditions.

$V_O$  defined by pin-strap. Standard configuration.

Characteristics		Conditions	min	typ	max	Unit
$f_{SW} = 1/T_{SW}$	Switching Frequency			320		kHz
	Switching Frequency Range, Note 1	PMBus configurable FREQUENCY_SWITCH	200		640	kHz
	Switching Frequency Set-point Accuracy		-5		5	%
	External Sync Pulse Width		150			ns
	Input Clock Frequency Drift Tolerance	External sync	-10		10	%

$T_{INIT}$	Initialization Time	From $V_I > -2.7$ V to ready to be enabled		67		ms
$T_{ONdel\_tot}$	Output voltage Total On Delay Time	Enable by input voltage		$T_{INIT} + T_{ONdel}$		
		Enable by CTRL pin		$T_{ONdel}$		
$T_{ONdel}$	Output voltage On Delay Time	Turn on delay duration		5		ms
		Range PMBus configurable TON_DELAY	3		250	ms
		Accuracy (actual delay vs set value)		-0/+2		ms
$T_{OFFdel}$	Output voltage Off Delay Time	Turn off delay duration, Note 2		0		ms
		Range PMBus configurable TOFF_DELAY	4		250	ms
		Accuracy (actual delay vs set value), Note 3		-0/+2		ms
$T_{ONrise}/$ $T_{OFFfall}$	Output voltage On/Off Ramp Time (0-100%-0 of $V_O$ )	Turn on ramp duration		5		ms
		Turn off ramp duration	Disabled in standard configuration. Turn off immediately upon expiration of Turn off delay.			
		Ramp duration range PMBus configurable TON_RISE/TOFF_FALL	0		100	ms
		Ramp time accuracy for standalone operation (actual ramp time vs set value)		±250		µs

Supported number of products in a current sharing group		4		

V <sub>OL</sub>	Logic output low signal level	SCL, SDA, SYNC, GCB, SALERT, PG Sink/source current = 2 mA		0.5	V	
V <sub>OH</sub>	Logic output high signal level		2.25		V	
I <sub>OL</sub>	Logic output low sink current			2	mA	
I <sub>OH</sub>	Logic output high source current			2	mA	
V <sub>IL</sub>	Logic input low threshold	SCL, SDA, CTRL, SYNC, GCB		0.8	V	
V <sub>IH</sub>	Logic input high threshold		2		V	
I <sub>L,LEAK</sub>	Logic leakage current	SCL, SDA, SYNC, SALERT, PG	-100		100	µA
C <sub>I,PIN</sub>	Logic pin input capacitance	SCL, SDA, CTRL, SYNC, GCB		12	pF	
R <sub>I,PU</sub>	Logic pin internal pull-up resistance	SCL, SDA, SALERT	No internal pull-up			
		CTRL to +5V	10		kΩ	
		GCB to +5V	47		kΩ	
f <sub>SMB</sub>	Supported SMBus Operating frequency		100		400	kHz
T <sub>BUF</sub>	SMBus Bus free time	STOP bit to START bit See section SMBus – Timing	1.3			µs
t <sub>set</sub>	SMBus SDA setup time from SCL	See section SMBus – Timing	100			ns
t <sub>hold</sub>	SMBus SDA hold time from SCL	See section SMBus – Timing	300			ns
	SMBus START/STOP condition setup/hold time from SCL		600			ns
T <sub>low</sub>	SCL low period		1.3			µs
T <sub>high</sub>	SCL high period		0.6			µs

Note 1. There are configuration changes to consider when changing the switching frequency, see section Switching Frequency.

Note 2. A default value of 0 ms forces the device to Immediate Off behavior with TOFF\_FALL ramp-down setting being ignored.

Note 3. The specified accuracy applies for off delay times larger than 4 ms. When setting 0 ms the actual delay will be 0 ms.

Note 4. Automatic restart ~280 ms after fault if the fault is no longer present. Continuous restart attempts if the fault reappear after restart. See Operating Information for other fault response options.

Note 5. The set OCP limit applies per phase. The total OCP limit will be twice the set value. Note that higher OCP threshold than specified may result in damage of the module at OC fault conditions.

Note 6. T<sub>SW</sub> is the switching period.

Note 7. See section Over Temperature Protection (OTP).

**EMC Specification**

Conducted EMI is measured according to the test set-up below. The typical fundamental switching frequency is 320 kHz.

**Conducted EMI** Input terminal value (typical for standard configuration).  $V_I = 12\text{ V}$ ,  $V_O = 1.0\text{ V}$ ,  $I_O = 90\text{ A}$ .

EMI without filter.

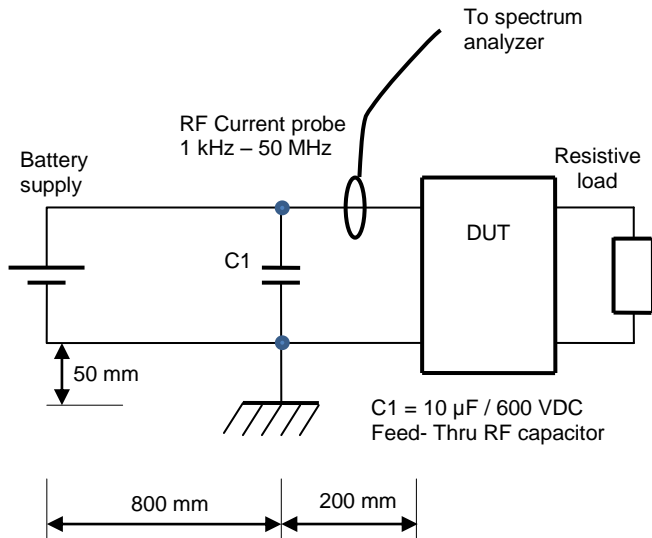

**Output Ripple and Noise**

Output ripple and noise are measured according to figure below. A 50 mm conductor works as a small inductor forming together with the two capacitances a damped filter.

Output ripple and noise test set-up.

The digital compensation of the product is designed to automatically provide stability, accurate line and load regulation and good transient performance for a wide range of operating conditions (switching frequency, input voltage, output voltage, output capacitance). Inherent from the implementation and normal to the product there will be some low frequency ripple at the output, in addition to the fundamental switching frequency output ripple. The total output ripple and noise is maintained at a low level.

Test set-up conducted emission, power lead.  
DUT = Product mounted on a 182 cm<sup>2</sup> test board with the external capacitances  $C_{IN} = 1000\text{ }\mu\text{F}/12\text{ m}\Omega + 24 \times 10\text{ }\mu\text{F}$  and  $C_{OUT} = 10 \times 470\text{ }\mu\text{F}/5\text{ m}\Omega + 10 \times 100\text{ }\mu\text{F}$ .

Example of low frequency ripple at the output.

**PMBus Interface**
**Power Management Overview**

This product incorporates a wide range of configurable power management features that are simple to implement with a minimum of external components. Additionally, the product includes protection features that continuously safeguard the load from damage due to unexpected system faults.

The product's standard configuration is suitable for a wide range of operation in terms of input voltage, output voltage, and load. The configuration is stored in an internal Non-Volatile Memory (NVM). All power management functions can be reconfigured using the PMBus interface.

Throughout this document, different PMBus commands are referenced. A detailed description of each command is provided in the appendix at the end of this specification.

The Ericsson Power Designer software suite can be used to configure and monitor this product via the PMBus interface. For more information please contact your local Ericsson sales representative.

**SMBus Interface**

The product can be used with any standard two-wire I<sup>2</sup>C or SMBus host device. See Electrical Specification for allowed clock frequency range. In addition, the product is compatible with PMBus version 1.2 and includes an SALERT line to help mitigate limitations related to continuous fault monitoring. The PMBus signals SCL, SDA and SALERT require passive pull-up resistors as stated in the SMBus Specification. Pull-up resistor values should be selected to guarantee the rise time according to equation below:

$$\tau = R_p C_p \leq 1\mu\text{s}$$

where  $R_p$  is the pull-up resistor value and  $C_p$  is the bus loading. The maximum allowed bus load is 400 pF. The pull-up resistor should be tied to an external supply voltage in range from 2.5 to 5.5 V, which should be present prior to or during power-up. If the proper power supply is not available, voltage dividers may be applied. Note that in this case, the resistance in the equation above corresponds to parallel connection of the resistors forming the voltage divider. See application note AN304 for details on interfacing the product with a microcontroller.

**PMBus Addressing**

The PMBus address is configured with a resistor connected between the SA pin and the PREF pin, as shown in the Typical Application Circuit. Recommended resistor values are shown in the table below. 1% tolerance resistors are required.

R <sub>SA</sub> [kΩ]	Address	R <sub>SA</sub> [kΩ]	Address
0 (short)	0x26	42.2	0x28
10	0x19	46.4	0x29
11	0x1A	51.1	0x2A
12.1	0x1B	56.2	0x2B
13.3	0x1C	61.9	0x2C
14.7	0x1D	68.1	0x2D
16.2	0x1E	75	0x2E
17.8	0x1F	82.5	0x2F
19.6	0x20	90.9	0x30
21.5	0x21	100	0x31
23.7	0x22	110	0x32
26.1	0x23	121	0x33
28.7	0x24	133	0x34
31.6	0x25	147	0x35
34.8	0x26	162	0x36
38.3	0x27	178	0x37
		Infinite (open)	0x28

**Reserved Addresses**

Addresses listed in the table below are reserved or assigned according to the SMBus specification and may not be usable. Refer to the SMBus specification for further information.

Address	Comment
0x00	General Call Address / START byte
0x01	CBUS address
0x02	Address reserved for different bus format
0x03 - 0x07	Reserved for future use
0x08	SMBus Host
0x09 - 0x0B	Assigned for Smart Battery
0x0C	SMBus Alert Response Address
0x28	Reserved for ACCESS.bus host
0x2C - 0x2D	Reserved by previous versions of the SMBus specification
0x37	Reserved for ACCESS.bus default address
0x40 - 0x44	Reserved by previous versions of the SMBus specification
0x48 - 0x4B	Unrestricted addresses
0x61	SMBus Device Default Address
0x78 - 0x7B	10-bit slave addressing
0x7C - 0x7F	Reserved for future use

**Monitoring via PMBus**

It is possible to continuously monitor a wide variety of parameters through the PMBus interface. These include, but are not limited to, the parameters listed in the table below.

Parameter	PMBus Command
Input voltage	READ_VIN
Output voltage	READ_VOUT
Total output current	READ_IOUT
Output current of each phase	READ_IOUT0 READ_IOUT1
Controller temperature (T <sub>P3</sub> )	READ_TEMPERATURE_1
Switching frequency	READ_FREQUENCY
Duty cycle	READ_DUTY_CYCLE
Highest temperature of power switches (T <sub>P1</sub> , T <sub>P2</sub> )	MFR_READ_VMON *

\* Reports a voltage level corresponding to the temperature. See command details in the end of this specification for formula to use.

**Monitoring Faults**

Fault conditions can be monitored using the SALERT pin, which will be asserted low when any number of pre-configured fault or warning conditions occur. The SALERT pin will be held low until faults and/or warnings are cleared by the CLEAR\_FAULTS command, or until the output voltage has been re-enabled.

It is possible to mask which fault conditions should not assert the SALERT pin by the command MFR\_SMBALERT\_MASK.

In response to the SALERT signal, the user may read a number of status commands to find out what fault or warning condition occurred, see table below.

Fault & Warning Status	PMBus Command
Overview, Power Good	STATUS_WORD STATUS_BYTE
Output voltage level	STATUS_VOUT
Output current level	STATUS_IOUT
Input voltage level	STATUS_INPUT
Temperature level	STATUS_TEMPERATURE
PMBus communication	STATUS_CML
Miscellaneous	STATUS_MFR_SPECIFIC

**Snapshot Parameter Capture**

This product offers a special feature that enables the user to capture parametric data during normal operation by a single PMBus command. The following parameters are stored:

- Input voltage
- Output voltage
- Output current
- Controller temperature
- Switching frequency
- Duty cycle
- Status and fault information

When a fault occurs the Snapshot functionality will automatically store this parametric data to NVM. The data can then later be read back using the SNAPSHOT command to provide valuable information for analysis. It is possible to select which faults will trigger a store to NVM by the PMBus command SNAPSHOT\_FAULT\_MASK. See application note AN320 for details on using the Snapshot feature.

**PMBus/I<sup>2</sup>C Timing**

Setup and hold times timing diagram.

The setup time,  $t_{set}$ , is the time data, SDA, must be stable before the rising edge of the clock signal, SCL. The hold time  $t_{hold}$ , is the time data, SDA, must be stable after the falling edge of the clock signal, SCL. If these times are violated incorrect data may be captured or meta-stability may occur and the bus communication may fail. All standard SMBus protocols must be followed, including clock stretching. Refer to the SMBus specification, for SMBus electrical and timing requirements.

This product supports the BUSY flag in the status commands to indicate product being too busy for SMBus response. A bus-free time delay according to this specification must occur between every SMBus transmission (between every stop & start condition).

The product supports PEC (Packet Error Checking) according to the SMBus specification.

When sending subsequent commands to the same module, it is recommended to insert additional delays according to the table below.

**BMR465 Series PoL Regulators**  
Input 7.5 - 14 V, Output up to 90 A / 162 W

28701 - BMR 465 Rev. D March 2016  
© Ericsson AB

After sending PMBus Command	Required delay before additional command
STORE_USER_ALL	100 ms
STORE_DEFAULT_ALL	
RESTORE_USER_ALL	100 ms
RESTORE_DEFAULT_ALL	
VOUT_MAX	10 ms
Any other command	2 ms after reading 10 ms after writing

**Non-Volatile Memory (NVM)**

The product incorporates two Non-Volatile Memory areas for storage of the PMBus command values; the Default NVM and the User NVM.

The Default NVM is pre-loaded with Ericsson factory default values. The Default NVM is write-protected and can be used to restore the Ericsson factory default values through the command RESTORE\_DEFAULT\_ALL.

The User NVM is pre-loaded with Ericsson factory default values. The User NVM is writable and open for customization. The values in NVM are loaded during initialization according to section Initialization Procedure, whereafter commands can be changed through the PMBus Interface. The STORE\_USER\_ALL command will store the changed parameters to the User NVM.

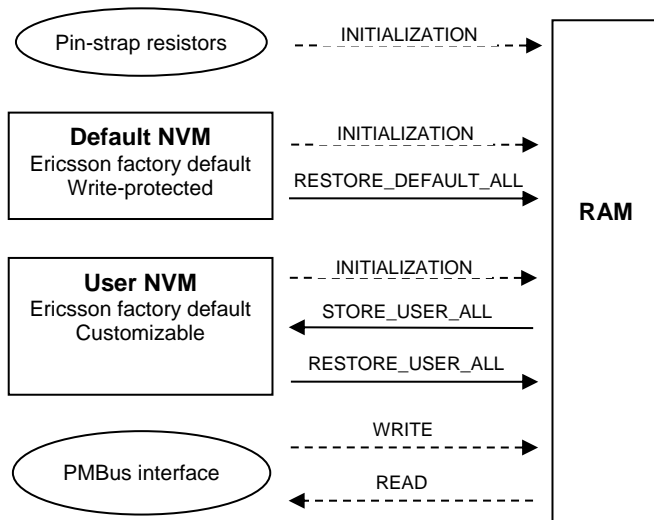

Illustration of memory areas of the product.

**Command Protection**

The user may write-protect specific PMBus commands in the User NVM by using the command UNPROTECT.

**Initialization Procedure**

The product follows an internal initialization procedure after power is applied to the VIN pins:

1. Self test and memory check.
2. The address pin-strap resistors are measured and the associated PMBus address is defined.
3. The output voltage pin-strap resistor is measured and the associated output voltage level will be loaded to operational RAM of PMBus command VOUT\_COMMAND.
4. Ericsson factory default values stored in default NVM memory are loaded to operational RAM. This overwrites any previously loaded values.
5. Values stored in the User NVM are loaded into operational RAM memory. This overwrites any previously loaded values (e.g. VOUT\_COMMAND by pin-strap).
6. Check for external clock signal at the SYNC pin and lock internal clock to the external clock if used.

Once this procedure is completed and the Initialization Time has passed (see Electrical Specification), the output voltage is ready to be enabled using the CTRL pin. The product is also ready to accept commands via the PMBus interface, which in case of writes will overwrite any values loaded during the initialization procedure.

Illustration Initialization time.

## Operating Information

### Input Voltage

The input voltage range 7.5 - 14 V makes the product easy to use in intermediate bus applications when powered by a non-regulated bus converter or a regulated bus converter.

### Input Under Voltage Protection (IUVP)

The product monitors the input voltage and will turn-on and turn-off at configured thresholds (see Electrical Specification). The turn-on input voltage threshold is set higher than the corresponding turn-off threshold. Hence, there is a hysteresis between turn-on and turn-off input voltage levels. Once the input voltage falls below the turn-off threshold, the device can respond in several ways as follows:

1. Immediate and definite shutdown of output voltage until the fault is cleared by PMBus command CLEAR\_FAULTS or the output voltage is re-enabled.
2. Immediate shutdown of output voltage while the input voltage is below the turn-on threshold. Operation resumes automatically and the output is enabled when the input voltage has risen above the turn-on threshold.

The default response is option 2. The IUVP function can be reconfigured using the PMBus commands VIN\_UV\_FAULT\_LIMIT (turn-off threshold), VIN\_UV\_WARN\_LIMIT (turn-on threshold) and VIN\_UV\_FAULT\_RESPONSE.

For products configured to operate in current sharing mode, response option 1 will always be used, regardless of VIN\_UV\_FAULT\_RESPONSE command settings.

### Input Over Voltage Protection (IOVP)

The product monitors the input voltage continuously and will respond as configured when the input voltage rises above the configured threshold level (see Electrical Specification). Refer to section "Input Under Voltage Protection" for functionality, response configuration options and default setting.

The IOVP function can be reconfigured using the PMBus commands VIN\_OV\_FAULT\_LIMIT (turn-off threshold), VIN\_OV\_WARN\_LIMIT (turn-on threshold) and VIN\_OV\_FAULT\_RESPONSE.

### Input and Output Impedance

The impedance of both the input source and the load will interact with the impedance of the product. It is important that the input source has low characteristic impedance. If the input voltage source contains significant inductance, the addition of a capacitor with low ESR at the input of the product will ensure stable operation.

### External Input Capacitors

The product is a two-phase converter which gives lower input ripple than a single phase design, see picture below. Thus, ripple-current-rating requirements for the input capacitors are lower relatively to a single phase converter.

The input ripple RMS current in a two-phase buck converter can be estimated to

$$I_{inputRMS} = I_{load} \sqrt{D(0.5 - D)} \quad (\text{valid for } D < 0.5)$$

Where  $I_{load}$  is the output load current and  $D$  is the duty cycle. The maximum load ripple current becomes  $I_{load}/4$ . The ripple current is divided into three parts, i.e., currents in the input source, external input capacitor, and internal input capacitor. How the current is divided depends on the impedance of the input source, ESR and capacitance values in the capacitors.

For most applications non-tantalum capacitors are preferred due to the robustness of such capacitors to accommodate high inrush currents of systems being powered from very low impedance sources. It is recommended to use a combination of ceramic capacitors and low-ESR electrolytic/polymer bulk capacitors. The low ESR of ceramic capacitors effectively limits the input ripple voltage level, while the bulk capacitance minimizes deviations in the input voltage at large load transients.

If several products are connected in a phase spreading setup the amount of input ripple current, and capacitance per product, can be reduced. The amount of input ripple current for such setup can be estimated using the Ericsson Power Designer software and capacitor selection can be made based on this number.

Ceramic input capacitors must be placed close to the input pins of a converter and with low impedance connections to the VIN and GND pins in order to be effective.

### External Output Capacitors

The output capacitor requirement depends on two considerations; output ripple voltage and load transient response. To achieve low ripple voltage, the output capacitor bank must have a low ESR value, which is achieved with ceramic output capacitors. A low ESR value is critical also for a small output voltage deviation during load transients. Designs

**BMR465 Series PoL Regulators**  
 Input 7.5 - 14 V, Output up to 90 A / 162 W

28701 - BMR 465 Rev. D March 2016  
 © Ericsson AB

with smaller load transients can use fewer capacitors and designs with more dynamic load content will require more load capacitors to minimize output voltage deviation. Improved transient response can also be achieved by adjusting the settings of the control loop of the product. Adding output capacitance decreases loop band-width.

It is recommended to place low ESR ceramic and low ESR electrolytic/polymer capacitors as close to the load as possible, using several capacitors in parallel to lower the effective ESR. It is important to use low resistance and low inductance PCB layouts in order for capacitance to be effective.

Optimization of output filter together with load step simulations can be made using the Ericsson Power Designer software. See application note AN321 for further guidelines on how to choose and apply output capacitors.

**Dynamic Loop Compensation (DLC)**

The typical design of regulated power converters includes a control function with a feedback loop that can be closed using either analog or digital circuits. The feedback loop is required to provide a stable output voltage, but should be optimized for the output filter to maintain output voltage regulation during transient conditions such as sudden changes in output current and/or input voltage. Digitally controlled converters allow one to optimize loop parameters without the need to change components on the board, however, optimization can still be challenging because the key parameters of the output filter include parasitic impedances in the PCB and the often distributed filter components themselves.

Dynamic Loop Compensation has been developed to solve the problem of compensation for a converter with a difficult to define output filter. This task is achieved by utilization of algorithms that can identify an arbitrary output filter based on accurate measurements of the output voltage in response to a very small excitation signal initiated by the algorithm, or occurring due to the changes in operating conditions, and automatically adjust feedback loop parameters to match the output filter.

**Control Loop**

The products use a fully digital control loop that achieves precise control of the entire power conversion process, resulting in a very flexible device that is also very easy to use. A non-linear charge-mode control algorithm is implemented that responds to output current changes within a single PWM switching cycle, achieving a smaller total output voltage variation with less output capacitance than traditional PWM controllers, thus saving cost and board space.

Control may be set more or less aggressive by adjusting a gain factor, set by the PMBus command ASCR\_CONFIG. Increasing the gain factor, i.e the control effort, will reduce the voltage deviation at load transients, at the expense of somewhat increased ripple on the output. Below graph exemplifies the effect of the gain factor on the voltage deviation during a load transient. The typical range of the gain factor is

200 - 600.

*Voltage deviation vs. control loop gain setting and output capacitance.*

The user may also adjust the residual factor, set by the ASCR\_CONFIG command, to improve the recovery time after a load transient. The typical usable range of the residual factor is 70 - 127. A higher value than 127 may damage the device and must not be used. A graph below illustrates the effect of the residual factor on the recovery time after a load transient. Note that also the gain factor will affect the recovery time.

*Recovery time vs. control loop residual setting and output capacitance.*

By default the product is configured with a moderate gain factor to provide a trade-off between load transient performance and output ripple for a wide range of operating conditions. For a specific application the gain factor can be increased to improve load transient response.

**BMR465 Series PoL Regulators**  
Input 7.5 - 14 V, Output up to 90 A / 162 W

28701 - BMR 465 Rev. D March 2016  
© Ericsson AB

Optimization of control loop settings and output filter, together with load step simulations, can be made using the Ericsson Power Designer software.

**Remote Sense**

The product has remote sense to compensate the voltage drops between the output and the point of load. The sense traces should be laid out as a differential pair and preferably be shielded by the PCB ground layer to reduce noise susceptibility. If the remote sense is not used, +S must be connected to VOUT and -S must be connected to GND.

In cases where the external output filter includes an inductor (forming a pi filter) according to the picture below, the  $L_{EXT}/C_{EXT}$  resonant frequency places an upper limit on the controller loop bandwidth. If the resonance frequency is high the sense lines can be connected after the filter (as shown in the picture) – if the resonant frequency is low and the DC drop from  $L_{EXT}$  is acceptable, sensing before the filter may be better.

External output filter with inductor (pi filter).

**Enabling Output Voltage**

The following options are available to enable and disable this device:

1. Output voltage is enabled through the CTRL pin.
2. Output voltage is enabled using the PMBus command OPERATION.

The CTRL pin can be used with active high (positive) logic or active low (negative) logic.

The CTRL pin polarity can be reconfigured using the PMBus command ON\_OFF\_CONFIG.

The CTRL pin has an internal 10 kΩ pull-up resistor to 5 V. The external device must have a sufficient sink current ability to be able pull CTRL pin voltage down below logic low threshold level (see Electrical Characteristics). When the CTRL pin is left open, the voltage on the CTRL pin is pulled up to 5 V.

If the device is to be synchronized to an external clock source, the clock frequency must be stable prior to enabling the output voltage.

**Output Voltage Adjust using Pin-strap Resistor**

Using an external Pin-strap resistor,  $R_{SET}$ , the output voltage can be set to several predefined levels shown in the table below. Only the voltage levels specified in the table can be set by  $R_{SET}$ . The resistor should be applied between the VSET pin and the PREF pin as shown in the Typical Application Circuit. Maximum 1% tolerance resistors are required.

$R_{SET}$ [kΩ]	$V_{OUT}$ [V]
0 (short)	1.00
10	0.60
11	0.65
12.1	0.70
13.3	0.75
14.7	0.80
16.2	0.85
17.8	0.90
19.6	0.95
21.5	1.00
23.7	1.05

$R_{SET}$ [kΩ]	$V_{OUT}$ [V]
26.1	1.10
28.7	1.15
31.6	1.20
34.8	1.25
38.3	1.30
42.2	1.40
46.4	1.50
51.1	1.60
56.2	1.70
61.9	1.80
Infinite (open)	1.20

$R_{SET}$  also sets the maximum output voltage; see section Output Voltage Range Limitation. The resistor is sensed only during the initialization procedure after application of input voltage. Changing the resistor value during normal operation will not change the output voltage. See Ordering Information for output voltage range.

**Output Voltage Adjust using PMBus**

The output voltage set by pin-strap can be overridden up to a certain level (see section Output Voltage Range Limitation) by using the PMBus command VOUT\_COMMAND. See Electrical Specification for adjustment range.

**Voltage Margining Up/Down**

Using the PMBus interface it is possible to adjust the output voltage to one of two predefined levels above or below the nominal voltage setting in order to determine whether the load device is capable of operating outside its specified supply voltage range. This provides a convenient method for dynamically testing the operation of the load circuit outside its typical operating range. This functionality can also be used to test of supply voltage supervisors. Margin limits of the nominal output voltage  $\pm 5\%$  are default, but the margin limits can be reconfigured using the PMBus commands VOUT\_MARGIN\_LOW and VOUT\_MARGIN\_HIGH. Margining is activated by the command OPERATION and can be used regardless of the output voltage being enabled by the CTRL pin or by the PMBus.

**Output Voltage Trim**

The actual output voltage can be trimmed to optimize performance of a specific load by setting a non-zero value for PMBus command VOUT\_TRIM. The value of VOUT\_TRIM is summed with the nominal output voltage set by VOUT\_COMMAND, allowing for multiple products to be commanded to a common nominal value, but with slight adjustments per load.

**Output Voltage Range Limitation**

The output voltage range that is possible to set by configuration or by the PMBus interface is hardware limited by the pin-strap resistor R<sub>SET</sub>. The maximum output voltage is set to 115% of the output value defined by R<sub>SET</sub>. This protects the application circuit from an over voltage due to an accidental PMBus command.

The limitation applies to the actual regulated output voltage rather than to the configured value. Thus, it is possible to write and read back a VOUT\_COMMAND value higher than the limit, but the actual output voltage will be limited.

The output voltage limit can be reconfigured to a lower than 115% of Vout value by writing the PMBus command VOUT\_MAX.

**Output Over Voltage Protection (OVP)**

The product includes over voltage limiting circuitry for protection of the load. The default OVP limit is 15% above the nominal output voltage. The product can be configured to respond in different ways to the output voltage exceeding the OVP limit:

1. Immediate and definite shutdown of output voltage until the fault is cleared by PMBus command CLEAR\_FAULTS or the output voltage is re-enabled.
2. Immediate shutdown of output voltage followed by continuous restart attempts of the output voltage with a preset interval ("hiccup" mode).

The default response is option 2. The OVP limit and fault response can be reconfigured using the PMBus commands VOUT\_OV\_FAULT\_LIMIT, VOUT\_OV\_FAULT\_RESPONSE and OVUV\_CONFIG.

For products configured to operate in current sharing mode, response option 1 will always be used, regardless of this command configuration.

**Output Under Voltage Protection (UVP)**

The product includes output under voltage limiting circuitry for protection of the load. The default UVP limit is 15% below the nominal output voltage. Refer to section Output Over Voltage Protection for response configuration options and default setting.

The UVP limit and fault response can be reconfigured using the PMBus commands VOUT\_UV\_FAULT\_LIMIT and VOUT\_UV\_FAULT\_RESPONSE.

**Power Good**

The power good pin (PG) indicates when the product is ready to provide regulated output voltage to the load. During ramp-up and during a fault condition, PG is held low. By default, PG is asserted high after the output has ramped to a voltage above 90% of the nominal voltage, and deasserted if the output voltage falls below 85% of the nominal voltage. These thresholds may be changed using the PMBus commands POWER\_GOOD\_ON and VOUT\_UV\_FAULT\_LIMIT.

The time between when the POWER\_GOOD\_ON threshold is reached and when the PG pin is actually asserted is set by the PMBus command POWER\_GOOD\_DELAY. See Electrical Specification for default value and range.

By default the PG pin is configured as an open drain output but it is also possible to set the output in push-pull mode by the command USER\_CONFIG.

The PG output is not defined during ramp up of the input voltage due to the initialization of the product.

**Over Current Protection (OCP)**

The product includes robust current limiting circuitry for protection at continuous overload. After ramp-up is complete the product can detect an output overload/short condition. The following OCP response options are available:

1. Immediate and definite shutdown of output voltage until the fault is cleared by PMBus command CLEAR\_FAULTS or the output voltage is re-enabled.
2. Immediate shutdown of output voltage followed by continuous restart attempts of the output voltage with a preset interval ("hiccup" mode).

The default response from an over current fault is option 2. Note that delayed shutdown is not supported. The load distribution should be designed for the maximum output short circuit current specified. The OCP limit and response can be reconfigured using the PMBus commands IOUT\_AVG\_OC\_FAULT\_LIMIT and MFR\_IOUT\_OC\_FAULT\_RESPONSE.

For products operated in current sharing mode, response option 1 will always be used, regardless of configuration.

**Under Current Protection (UCP)**

The product includes robust current limiting circuitry for protection at continuous reversed current, due to a synchronous rectifier ability to sink current. Refer to section Over Current Protection for response configuration options and default setting. The UCP limit and response can be reconfigured using the PMBus commands IOUT\_AVG\_UC\_FAULT\_LIMIT and MFR\_IOUT\_UC\_FAULT\_RESPONSE.

 Input 7.5 - 14 V, Output up to 90 A / 162 W

28701 - BMR 465 Rev. D March 2016  
 © Ericsson AB

**Switching Frequency**

The default switching frequency is chosen as the best tradeoff between efficiency and thermal performance, output ripple and load transient performance. The switching frequency can be re-configured in a certain range using the PMBus command FREQUENCY\_SWITCH. Refer to Electrical Specification for default switching frequency and range. Changing the switching frequency will affect efficiency and power dissipation, load transient response (control loop characteristics) and output ripple. Control loop settings may need to be adjusted.

Note that since the product has two phases the effective switching frequency will be twice the configured.

**Synchronization**

Two or more products may be synchronized with an external clock to eliminate beat frequencies reflected back to the input supply rail. Eliminating the slow beat frequencies (usually <10 kHz) relaxes the filtering requirements. Synchronization can also be utilized for phase spreading, described in section Phase Spreading.

The products can be synchronized with an external oscillator or one product can be configured with the SYNC pin as a SYNC output, working as a source of synchronization signal for other products connected to the same synchronization line. The SYNC pin of products being synchronized must be configured as SYNC Input. Default configuration is using the internal clock, independently of signal at the SYNC pin. Synchronization is configured using PMBus command MFR\_USER\_CONFIG. See application note AN309 for further information.

**Phase Spreading**

When multiple products share a common DC input supply, spreading of the switching clock phase between the products can be utilized. This dramatically reduces input capacitance requirements and efficiency losses, since the peak current drawn from the input supply is effectively spread out over the whole switch period. This requires that the products are synchronized using the SYNC pin.

The phase offset is measured from the rising edge of the applied external clock to the rising edge of the PWM pulse as illustrated below.

Illustration of phase offset.

The phase offset is configured using the PMBus command INTERLEAVE and is defined as:

$$Phase\_offset(^{\circ}) = 360^{\circ} \times \frac{Interleave\_order}{Number\_in\_group}$$

Interleave\_order is in the range 0-15. Number\_in\_group is in the range 0-15 where a value of 0 means 16. The set resolution for the phase offset is  $360^{\circ} / 16 = 22.5^{\circ}$ .

By default Number\_in\_group = 0 and Interleave\_order = Four LSB's of set PMBus address (see section PMBus Addressing).

Optimized phase spreading for several modules is easily set up using Ericsson Power Designer software. See application note AN309 for further information.

**Soft-start and Soft-stop**

The soft-start and soft-stop control functionality allows the output voltage to ramp-up and ramp-down with defined timing with respect to the control of the output. This can be used to control inrush current and manage supply sequencing of multiple controllers.

The rise time is the time taken for the output to ramp to its target voltage, while the fall time is the time taken for the output to ramp down from its regulation voltage to 0 V. The on delay time sets a delay from when the output is enabled until the output voltage starts to ramp up. The off delay time sets a delay from when the output is disabled until the output voltage starts to ramp down.

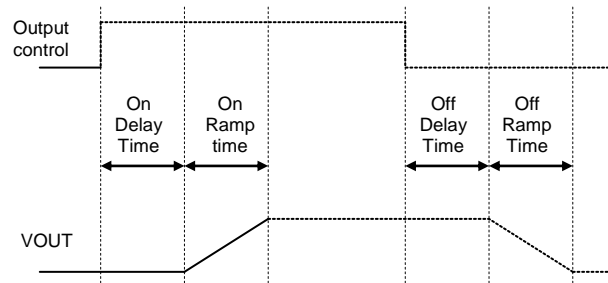

Illustration of Soft-Start and Soft-Stop.

By default soft-stop is disabled and the regulation of output voltage stops immediately when the output is disabled. Soft-stop can be enabled through the PMBus command ON\_OFF\_CONFIG. The delay and ramp times can be reconfigured using the PMBus commands TON\_DELAY, TON\_RISE, TOFF\_DELAY and TOFF\_FALL.

**Output Voltage Sequencing**

A group of products may be configured to power up in a predetermined sequence. This feature is especially useful when powering advanced processors, FPGAs, and ASICs that require one supply to reach its operating voltage prior to another.

**BMR465 Series PoL Regulators**  
Input 7.5 - 14 V, Output up to 90 A / 162 W

28701 - BMR 465 Rev. D March 2016  
© Ericsson AB

Illustration of Output Voltage Sequencing.

Different types of multi-product sequencing are supported:

1. Time based sequencing. Configuring the start delay and rise time of each module through the PMBus interface and by connecting the CTRL pin of each product to a common enable signal.
2. Event based sequencing. Routing the PG pin signal of one module to the CTRL pin of the next module in the sequence.
3. GCB based sequencing. Power Good triggered sequencing with the sequence order defined by configuration. Configured through the PMBus interface and uses the GCB bus, see section Group Communication Bus.

These sequencing options are easily configured using the Ericsson Power Designer software. See application note AN310 for further information.

**Pre-Bias Startup Capability**

Pre-bias startup often occurs in complex digital systems when current from another power source is fed back through a dual-supply logic component, such as FPGAs or ASICs. There could also be still charged output capacitors when starting up shortly after turn-off.

The product incorporates synchronous rectifiers, but will not sink current during startup, or turn off, or whenever a fault shuts down the product in a pre-bias condition.

Illustration of Pre-Bias Startup.

**Voltage Tracking**

The product integrates a lossless tracking scheme that allows its output to track a voltage that is applied to the VTRK pin with no external components required. During ramp-up, the output voltage follows the VTRK voltage until the preset output voltage level is met. The product offers two modes of tracking as follows:

1. Coincident. This mode configures the product to ramp its output voltage at the same rate as the voltage applied to the VTRK pin.

Illustration of Coincident Voltage Tracking.

2. Ratiometric. In this mode the product ramps its output voltage at a rate that is a percentage of the voltage applied to the VTRK pin. Ratiometric tracking is achieved by configuring the product for coincident tracking and adding an external resistive voltage divider.

Illustration of Ratiometric Voltage Tracking.

The master device in a tracking group is defined as the device that has the highest target output voltage within the group. This master device will control the ramp rate of all tracking devices and is not configured for tracking mode. Any device configured in tracking mode will ignore its soft-start/stop settings and take on the turn-on/turn-off characteristics of the voltage present at the VTRK pin.

**BMR465 Series PoL Regulators**  
Input 7.5 - 14 V, Output up to 90 A / 162 W

28701 - BMR 465 Rev. D March 2016

© Ericsson AB

All of the CTRL pins in the tracking group must be connected and driven by a single logic source. Tracking is configured using the PMBus command TRACK\_CONFIG.

Tracking configurations are easily set up using Ericsson Power Designer software. See application note AN310 for further details and limitations of the tracking functionality.

**Group Communication Bus**

The Group Communication Bus, GCB, is used to communicate between products. This dedicated single wire bus provides the communication channel between devices for features such as sequencing, fault spreading and current sharing. The GCB solves the PMBus data rate limitation. The GCB pin on all devices in an application should be connected together. A pull-up resistor is required on the common GCB in order to guarantee the rise time as according to equation below:

$$\tau = R_{GCB} C_{GCB} \leq 1 \mu s$$

where  $R_{GCB}$  is the pull up resistor value and  $C_{GCB}$  is the bus loading. The pull-up resistor should be tied to an external supply voltage in range from 2.5 to 5.5 V, which should be present prior to or during power-up.

The GCB is an internal bus, such that it is only connected across the modules and not the PMBus system host. GCB addresses are assigned on a rail level, i.e. modules within the same current sharing group share the same GCB address. Addressing rails across the GCB is done with a 5 bit GCB ID, yielding a theoretical total of 32 rails that can be shared with a single GCB bus.

By default the GCB ID is set to the five LSB's of set PMBus address (see section PMBus Addressing).

Limitations apply when using this product on the same GCB bus as other Ericsson Power Modules POL products operated in parallel. Please contact your sales representative for detailed information.

**Parallel Operation (Current Sharing)**

Paralleling multiple products can be used to increase the output current capability of a single power rail. By connecting the GCB and SYNC pins of each device and configuring the devices as a current sharing rail, the units will share the current equally, enabling up to 100% utilization of the current capability for each device in the current sharing rail. The product uses a low-bandwidth, first-order digital current sharing by aligning the output voltage of the slave devices to deliver the same current as the master device. Artificial droop resistance is added to the output voltage path to control the slope of the load line curve, calibrating out the physical parasitic mismatches due to power train components and PWB layout. Up to 4 devices can be configured in a given current sharing group.

By connecting the FAULT pins of all products in a current sharing group together, it is made sure that the internal power stages of all products shut down quickly and simultaneously in response to a fault that occurs in one of the products. Note that continuous restarts after a fault ("hiccup mode") are not supported for parallel operation.

Parallel operation is easily configured using Ericsson Power Designer software. See application note AN307 for further information.

**Broadcast Control**

The product can be configured to broadcast output voltage enable or setting of output voltage level over the GCB bus to other devices in the group. If configured to do so, a device receiving a PMBus OPERATION command or VOUT\_COMMAND command will broadcast the same command over the GCB bus, and other devices on the GCB bus will respond to the same commands, if configured to do so. Broadcast control is configured using the PMBus command GCB\_GROUP.

**Fault spreading**

The product can be configured to broadcast a fault event over the GCB bus to the other devices in the group. When a non-destructive fault occurs and the device is configured to shut down on a fault, the device will shut down and broadcast the fault event over the GCB bus. The other devices on the GCB bus will shut down together if configured to do so, and will attempt to re-start in their prescribed order if configured to do so. Fault spreading is configured using the PMBus command GCB\_GROUP or LEGACY\_FAULT\_GROUP.

**Thermal Consideration**

**General**

The product is designed to operate in different thermal environments and sufficient cooling must be provided to ensure reliable operation. Cooling is achieved mainly by conduction, from the pins to the host board, and convection, which is dependent on the airflow across the product. Increased airflow enhances the cooling of the product.

The Output Current Derating graph found in the Output section for each model provides the available output current vs. ambient air temperature and air velocity at specified  $V_i$ .

The product is tested on a 254 x 254 mm, 35  $\mu$ m (1 oz), test board mounted vertically in a wind tunnel with a cross-section of 608 x 203 mm. The test board has 16 layers.

See Design Note 019 for further information.

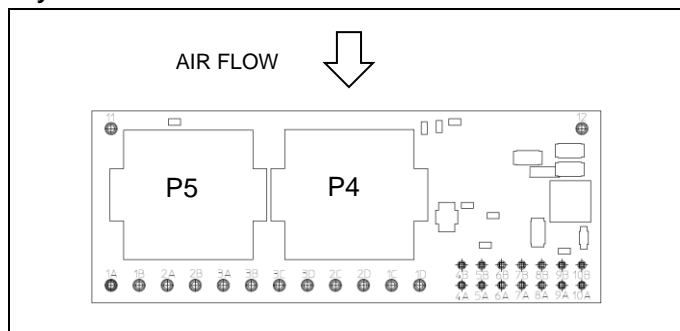

**Definition of Product Operating Temperature**

The temperature at positions P1, P2, P3, P4 and P5 should not exceed the maximum temperatures in the table below. The number of measurement points may vary with different thermal design and topology. Temperatures above specified maximum measured at the specified positions are not allowed and may cause permanent damage.

Note that the max values are the absolute maximum rating (non destruction) and that the provided Electrical Specification data is guaranteed up to  $T_{P1} = +95$  °C.

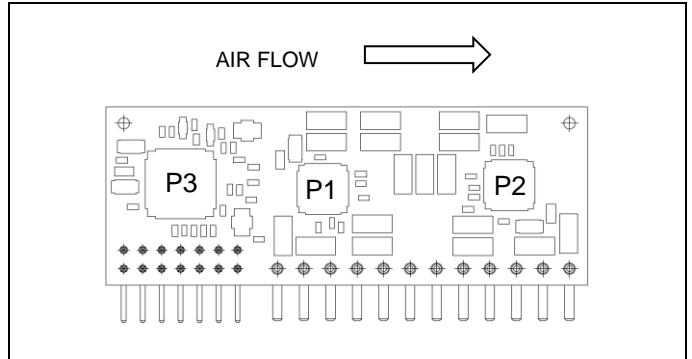

Position	Description	Max Temperature
P1	N2, Power switch Reference point, hot spot	$T_{P1} = 130$ °C
P2	N3, Power switch	$T_{P2} = 130$ °C
P3	N1, Control circuit	$T_{P3} = 125$ °C
P4	L1, Power inductor	$T_{P4} = 125$ °C
P5	L2, Power inductor	$T_{P5} = 125$ °C

**Lay Down versions**

Temperature positions and air flow direction (top view).

**SIP version**

Temperature positions and air flow direction.

Note that the same PCB is used for both Lay Down and SIP versions. Thus, the positions indicated in the pictures apply to both versions.

P1 is typically the hot spot (the position with the highest temperature). On the laydown versions only P4 and P5 are accessible when the module is soldered to the application board. However the temperature at P3 and the highest temperature at P1/P2 can be monitored via the PMBus interface (see section Monitoring via PMBus). If still only P4 and P5 are used when temperatures are recorded, the max allowed temperature at P4 and P5 should be lowered to 115 °C.

**Definition of Reference Temperature  $T_{P1}$**

The temperature at position P1 has been used as a reference temperature for the Electrical Specification data provided.

**Over Temperature Protection (OTP)**

The products are protected from thermal overload by dual internal over temperature shutdown functions:

1. Temperature in controller N1, located in position P3.
2. The highest temperature of power switches N2 and N3, located in positions P1 and P2.

These temperatures are continuously monitored and when a temperature rises above the configured fault threshold level the product will respond as configured. The product can respond in several ways as follows:

1. Immediate and definite shutdown of output voltage until the fault is cleared by PMBus command CLEAR\_FAULTS or the output voltage is re-enabled.
2. Immediate shutdown of output voltage while the temperature is above the warning threshold. Operation resumes automatically and the output is enabled when the temperature has fallen below the warning threshold, i.e. there is a hysteresis defined by the difference between the fault threshold and the warning threshold.

Default response is option 2. The default OTP thresholds and hysteresis are specified in Electrical Characteristics.

**BMR465 Series PoL Regulators**  
Input 7.5 - 14 V, Output up to 90 A / 162 W

28701 - BMR 465 Rev. D March 2016

© Ericsson AB

The OTP limit, hysteresis and response for temperature in position P3 is configured using the PMBus commands OT\_FAULT\_LIMIT, OT\_WARN\_LIMIT and OT\_FAULT\_RESPONSE.

The OTP limit, hysteresis and response for highest temperature of positions P1 and P2 are configured using the PMBus commands MFR\_VMON\_OV\_FAULT\_LIMIT and VMON\_OV\_FAULT\_RESPONSE.

For products operated in current sharing mode, response option 1 will always be used, regardless of configuration.

### PCB Layout Consideration

The radiated EMI performance of the product will depend on the PCB layout and ground layer design. If a ground layer is used, it should be connected to the output of the product and the equipment ground or chassis.

A ground layer will increase the stray capacitance in the PCB and improve the high frequency EMC performance.

Further layout recommendations are listed below.

- The pin strap resistors,  $R_{SET}$ , and  $R_{SA}$  should be placed as close to the product as possible to minimize loops that may pick up noise. Avoid capacitive load on these signals as it may result in false pin strap reading.
- Avoid current carrying planes under the pin strap resistors and the PMBus signals.
- The capacitors  $C_{IN}$  should be placed as close to the input pins as possible and with low impedance connections, e.g. using stitched vias around capacitors' terminals.
- The capacitors  $C_{OUT}$  should in general be placed close to the load. However typically you would like to place larger ceramic output capacitors close to the module output in order to handle the output ripple current. See AN321 for more details. Low impedance connections must be used, e.g. stitched vias around capacitors' terminals.
- Care should be taken in the routing of the connections from the sensed output voltage to the S+ and S- terminals. These sensing connections should be routed as a differential pair, preferably between ground planes which are not carrying high currents. The routing should avoid areas of high electric or magnetic fields. In case of current sharing (parallel) operation each module must sense at the same points.
- If possible use planes on several layers to carry  $V_I$ ,  $V_O$  and GND. There should be a large number of vias close to the VIN, VOUT and GND pads in order to lower input and output impedances and improve heat spreading between the product and the host board.

**Soldering Information – Surface Mounting and Hole Mount through Pin in Paste Assembly**

The surface mount product is intended for forced convection or vapor phase reflow soldering in SnPb or Pb-free processes.

The reflow profile should be optimised to avoid excessive heating of the product. It is recommended to have a sufficiently extended preheat time to ensure an even temperature across the host PWB and it is also recommended to minimize the time in reflow.

A no-clean flux is recommended to avoid entrapment of cleaning fluids in cavities inside the product or between the product and the host board, since cleaning residues may affect long time reliability and isolation voltage.

General reflow process specifications		SnPb eutectic	Pb-free
Average ramp-up ( $T_{PRODUCT}$ )		3°C/s max	3°C/s max
Typical solder melting (liquidus) temperature	$T_L$	183°C	221°C
Minimum reflow time above $T_L$		60 s	60 s
Minimum pin temperature	$T_{PIN}$	210°C	235°C
Peak product temperature	$T_{PRODUCT}$	225°C	260°C
Average ramp-down ( $T_{PRODUCT}$ )		6°C/s max	6°C/s max
Maximum time 25°C to peak		6 minutes	8 minutes

**Minimum Pin Temperature Recommendations**

Pin number 3C is chosen as reference location for the minimum pin temperature recommendation since this will likely be the coolest solder joint during the reflow process.

**SnPb solder processes**

For SnPb solder processes, a pin temperature ( $T_{PIN}$ ) in excess of the solder melting temperature, ( $T_L$ , 183°C for Sn63Pb37) for more than 60 seconds and a peak temperature of 220°C is recommended to ensure a reliable solder joint.

For dry packed products only: depending on the type of solder paste and flux system used on the host board, up to a recommended maximum temperature of 245°C could be used, if the products are kept in a controlled environment (dry pack handling and storage) prior to assembly.

**Lead-free (Pb-free) solder processes**

For Pb-free solder processes, a pin temperature ( $T_{PIN}$ ) in excess of the solder melting temperature ( $T_L$ , 217 to 221°C for SnAgCu solder alloys) for more than 60 seconds and a peak

temperature of 245°C on all solder joints is recommended to ensure a reliable solder joint.

**Maximum Product Temperature Requirements**

Top of the product PWB near pin 10A is chosen as reference location for the maximum (peak) allowed product temperature ( $T_{PRODUCT}$ ) since this will likely be the warmest part of the product during the reflow process.

**SnPb solder processes**

For SnPb solder processes, the product is qualified for MSL 1 according to IPC/JEDEC standard J-STD-020C.

During reflow  $T_{PRODUCT}$  must not exceed 225 °C at any time.

**Pb-free solder processes**

For Pb-free solder processes, the product is qualified for MSL 3 according to IPC/JEDEC standard J-STD-020C.

During reflow  $T_{PRODUCT}$  must not exceed 260 °C at any time.

**Dry Pack Information**

Products intended for Pb-free reflow soldering processes are delivered in standard moisture barrier bags according to IPC/JEDEC standard J-STD-033 (Handling, packing, shipping and use of moisture/reflow sensitivity surface mount devices).

Using products in high temperature Pb-free soldering processes requires dry pack storage and handling. In case the products have been stored in an uncontrolled environment and no longer can be considered dry, the modules must be baked according to J-STD-033.

**Thermocoupler Attachment**

Pin 3C for measurement of minimum Pin (solder joint) temperature,  $T_{PIN}$

Top of PWB near Pin 10A for measurement of maximum product temperature,  $T_{PRODUCT}$

**BMR465 Series PoL Regulators**  
Input 7.5 - 14 V, Output up to 90 A / 162 W

28701 - BMR 465 Rev. D March 2016  
© Ericsson AB

**Soldering Information - Hole Mounting**

The hole mounted product is intended for plated through hole mounting by wave or manual soldering. The pin temperature is specified to maximum to 270°C for maximum 10 seconds.

A maximum preheat rate of 4°C/s and maximum preheat temperature of 150°C is suggested. When soldering by hand, care should be taken to avoid direct contact between the hot soldering iron tip and the pins for more than a few seconds in order to prevent overheating.

A no-clean flux is recommended to avoid entrapment of cleaning fluids in cavities inside the product or between the product and the host board. The cleaning residues may affect long time reliability and isolation voltage.

**Delivery Package Information**

The products are delivered in antistatic trays (SIP variant) and in antistatic carrier tape (laydown variant, EIA 481 standard). All versions are delivered in dry-pack.

Tray Specifications	
Material	ESD PS
Surface resistance	10 < Ohm/square < 10 <sup>5</sup>
Bakability	The trays are not bakable
Tray thickness	18 mm [ 0.724 inch]
Box capacity	144 products (8 full trays/box)
Tray weight	59.2 g empty [444.4 g full tray]

Carrier Tape Specifications	
Material	Antistatic PS
Surface resistance	10 <sup>5</sup> < Ohm/square < 10 <sup>10</sup>
Bakeability	The tape is not bakable
Tape width, W	72 mm [2.83 inch]
Pocket pitch, P <sub>1</sub>	32 mm [1.26 inch]
Pocket depth, K <sub>0</sub>	14.6 mm [0.575 inch]
Reel diameter	330 mm [13 inch]
Reel capacity	130 products /reel
Reel weight	565 g empty [3347 g full reel]

## Appendix - PMBus Commands

This appendix contains a detailed reference of the PMBus commands supported by the product.

### Data Formats

The products make use of a few standardized numerical formats, along with custom data formats. A detailed walkthrough of the above formats is provided in AN304, as well as in sections 7 and 8 of the PMBus Specification Part II. The custom data formats vary depending on the command, and are detailed in the command description.

### Standard Commands

The functionality of commands with code 0x00 to 0xCF is usually based on the corresponding command specification provided in the PMBus Standard Specification Part II (see Power System Management Bus Protocol Documents below). However there might be different interpretations of the PMBus Standard Specification or only parts of the Standard Specification applied, thus the detailed command description below should always be consulted.

### Forum Websites

The System Management Interface Forum (SMIF)

<http://www.powersig.org/>

The System Management Interface Forum (SMIF) supports the rapid advancement of an efficient and compatible technology base that promotes power management and systems technology implementations. The SMIF provides a membership path for any company or individual to be active participants in any or all of the various working groups established by the implementer forums.

Power Management Bus Implementers Forum  
(PMBUS-IF)

<http://pmbus.org/>

The PMBus-IF supports the advancement and early adoption of the PMBus protocol for power management. This website offers recent PMBus specification documents, PMBus articles, as well as upcoming PMBus presentations and seminars, PMBus Document Review Board (DRB) meeting notes, and other PMBus related news.

### PMBus – Power System Management Bus Protocol Documents

These specification documents may be obtained from the PMBus-IF website described above. These are required reading for complete understanding of the PMBus implementation. This appendix will not re-address all of the details contained within the two PMBus Specification documents.

Specification Part I – General Requirements Transport And Electrical Interface

Includes the general requirements, defines the transport and electrical interface and timing requirements of hard wired signals.

Specification Part II – Command Language

Describes the operation of commands, data formats, fault management and defines the command language used with the PMBus.

### SMBus – System Management Bus Documents

System Management Bus Specification, Version 2.0, August 3, 2000

This specification specifies the version of the SMBus on which Revision 1.2 of the PMBus Specification is based. This specification is freely available from the System Management Interface Forum Web site at:

<http://www.smbus.org/specs/>

**PMBus Command Details**
**OPERATION (0x01)**

Transfer Type: R/W Byte

Description: Controls enable and margin operations.

Bit	Function	Description	Value	Function	Description
7:6	Enable	Make the device enable or disable if PMBus Enable has been activated in ON_OFF_CONFIG.	00	Immediate Off	Disable Immediately without controlled ramp-down.
			01	Soft Off	Disable "Softly" by controlled ramp-down defined by TOFF_FALL.
			10	Enable	Enable device to the chosen voltage level.
5:4	Margin	Select between margin high/low states or nominal output.	00	Nominal	Operate at nominal output voltage.
			01	Margin Low	Operate at voltage set by command VOUT_MARGIN_LOW.
			10	Margin High	Operate at voltage set by command VOUT_MARGIN_HIGH.
3:2	Act on Fault	Controls whether the device during margining will ignore or handle overvoltage/undervoltage warnings and faults and respond as programmed by the fault response commands.	01	Ignore Faults	Ignore Faults when in a margined state.
			10	Act on Faults	Act on Faults when in a margined state.

**ON\_OFF\_CONFIG (0x02)**

Transfer Type: R/W Byte

Description: Configures how the device is controlled by the CTRL pin and the PMBus.

Bit	Function	Description	Value	Function	Description
4	Powerup Operation		1	CTRL pin or PMBus	Device does not power up until commanded by the CTRL pin or OPERATION command.
3	PMBus Enable Mode	Controls how the device responds to the PMBus command OPERATION.	0	Ignore PMBus command	Ignores the on/off portion of the OPERATION command.
			1	Use PMBus command	Device requires on by OPERATION command to enable the output voltage.
2	Enable Pin Mode	Controls how the device responds to the CTRL pin.	0	Ignore CTRL pin	Device ignores the CTRL pin.
			1	Use CTRL pin	Device requires the CTRL pin to be asserted to enable the output voltage.
1	Enable Pin Polarity	Polarity of the CTRL pin.	0	Active Low	CTRL pin will cause device to enable when driven low.
			1	Active High	CTRL pin will cause device to enable when driven high.
0	Disable Action	CTRL pin action when commanding the output to turn off.	0	Soft Off	Use the configured turn off delay and fall time.
			1	Immediate Off	Turn off the output and stop transferring energy to the output as fast as possible. The device's product literature shall specify whether or not the device sinks current to decrease the output voltage fall time.

**BMR465 Series PoL Regulators**

**CLEAR\_FAULTS (0x03)**

Transfer Type: Send Byte

Description: Clears all fault status bits

**STORE\_DEFAULT\_ALL (0x11)**

Transfer Type: Send Byte

Description: Commands the device to store its configuration into the Default Store.

**RESTORE\_DEFAULT\_ALL (0x12)**

Transfer Type: Send Byte

Description: Commands the device to restore its configuration from the Default Store.

**STORE\_USER\_ALL (0x15)**

Transfer Type: Send Byte

Description: Stores, at the USER level, all PMBus values that were changed since the last restore command. To add to the USER store, perform a RESTORE\_USER\_ALL, write commands to be added, then STORE\_USER\_ALL. Wait 20 ms after a STORE\_USER\_ALL command before issuing another PMBus command.

**RESTORE\_USER\_ALL (0x16)**

Transfer Type: Send Byte

Description: Restores PMBus settings that were stored using STORE\_USER\_ALL. This command is automatically performed at power up. The values restored will overwrite the values previously loaded by the RESTORE\_DEFAULT\_ALL command. The security level is changed to Level 1 following this command. Wait 20 ms after a RESTORE\_USER\_ALL command before issuing another PMBus command.

**VOUT\_MODE (0x20)**

Transfer Type: Read Byte

Description: Controls how future VOUT-related commands parameters will be interpreted.

Bit	Function	Description	Format
4:0		Five bit two's complement EXPONENT for the MANTISSA delivered as the data bytes for VOUT_COMMAND in VOUT_LINEAR Mode.	Integer Signed

Bit	Function	Description	Value	Function	Description
7:5		Selection of mode for representation of output voltage parameters.	000	Linear	Linear Mode Format.
			001	VID	VID Mode.
			010	Direct	Direct Mode.

**VOUT\_COMMAND (0x21)**

Transfer Type: R/W Word

Description: Sets the nominal value of the output voltage.

Bit	Description	Format	Unit
15:0	Sets the nominal value of the output voltage.	Vout Mode Unsigned	V

**VOUT\_TRIM (0x22)**

Transfer Type: R/W Word

Description: Configures a fixed offset to be applied to the output voltage when enabled.

Bit	Description	Format	Unit
15:0	Sets VOUT trim value. The range is limited to +/-150 mV.	Vout Mode Signed	V

**VOUT\_CAL\_OFFSET (0x23)**

Transfer Type: R/W Word

Description: Configures a fixed offset to be applied to the output voltage when enabled.

Bit	Description	Format	Unit
-----	-------------	--------	------

**BMR465 Series PoL Regulators**  
 Input 7.5 - 14 V, Output up to 90 A / 162 W

28701 - BMR 465 Rev. D March 2016

© Ericsson AB

Bit	Description	Format	Unit
15:0	Sets VOUT calibration offset(same function as VOUT_TRIM).	Vout Mode Signed	V

**VOUT\_MAX (0x24)**

Transfer Type: R/W Word

Description: Configures the maximum allowed output voltage.

Bit	Description	Format	Unit
15:0	If the device is commanded to a Vout value higher than this level, the output voltage will be clamped to this level. The max VOUT_MAX setting is 115% of the VSET pin-strap setting.	Vout Mode Unsigned	V

**VOUT\_MARGIN\_HIGH (0x25)**

Transfer Type: R/W Word

Description: Configures the target for margin-up commands.

Bit	Description	Format	Unit
15:0	Sets the output voltage value during a margin high.	Vout Mode Unsigned	V

**VOUT\_MARGIN\_LOW (0x26)**

Transfer Type: R/W Word

Description: Configures the target for margin-down commands.

Bit	Description	Format	Unit
15:0	Sets the output voltage value during a margin low.	Vout Mode Unsigned	V

**VOUT\_TRANSITION\_RATE (0x27)**

Transfer Type: R/W Word

Description: Sets the transition rate when changing output voltage.

Bit	Description	Format	Unit
15:0	Configures the transition time for margining and on-the-fly VOUT_COMMAND changes.	Linear	V/ms

**VOUT\_DROOP (0x28)**

Transfer Type: R/W Word

Description: Configures a droop of output voltage.

Bit	Description	Format	Unit
15:0	Sets the effective load line (V/I slope) for the rail in which the device is used. When the device is part of a current sharing rail, this value must be non-zero and the same for all devices in the rail.	Linear	mV/A

**FREQUENCY\_SWITCH (0x33)**

Transfer Type: R/W Word

Description: Controls the switching frequency.

Bit	Description	Format	Unit
15:0	Sets the switching frequency in 1 kHz steps. The specified range is 200 - 640 kHz.	Linear	kHz

**INTERLEAVE (0x37)**

Transfer Type: R/W Word

Description: Configures the phase offset with respect to a common SYNC clock.

Bit	Function	Description	Format
15:8	Dummy	Not used.	Integer Unsigned
7:4	Number of Rails	Value 0-15. Sets the number of rails in the group. A value of 0 is interpreted as 16.	Integer Unsigned

**BMR465 Series PoL Regulators**  
 Input 7.5 - 14 V, Output up to 90 A / 162 W

28701 - BMR 465 Rev. D

March 2016

© Ericsson AB

Bit	Function	Description	Format
3:0	Rail Position	Value 0-15. Sets position of the device's rail within the group.	Integer Unsigned

**VOUT\_OV\_FAULT\_LIMIT (0x40)**

Transfer Type: R/W Word

Description: Sets the VOUT overvoltage fault threshold.

Bit	Description	Format	Unit
15:0	Sets the VOUT overvoltage fault threshold.	Vout Mode Unsigned	V

**VOUT\_OV\_FAULT\_RESPONSE (0x41)**

Transfer Type: R/W Byte

Description: Sets the VOUT OV fault response.

Bit	Function	Description	Value	Function	Description
7:6	Response	Describes the device interruption operation. For all modes set by bits [7:6], the device pulls SALERT low and sets the related fault bit in the status registers.	10	Disable and Retry	Disable the output without delay and retry according to the setting in bits [5:3].
5:3	Retry Setting	The device attempts to restart the number of times set by these bits.	000	Do Not Retry	A zero value for the Retry Setting means that the unit does not attempt to restart. The output remains disabled until the fault is cleared.
			111	Retry Continuously	The PMBus device attempts to restart continuously, without limitation, until output is DISABLED, bias power is removed, or another fault condition causes the output to shut down.
2:0	Retry Time	Retry delay time = (Value + 1) * 35 ms. Sets the time between retries in 35 ms increments. Range is 35 ms to 280 ms.	000	35 ms	
			001	70 ms	
			010	105 ms	
			011	140 ms	
			100	175 ms	
			101	210 ms	
			110	245 ms	
			111	280 ms	

**VOUT\_UV\_FAULT\_LIMIT (0x44)**

Transfer Type: R/W Word

Description: Sets the VOUT under-voltage fault threshold. This threshold is also used for deasserting PG (Power Good).

Bit	Description	Format	Unit
15:0	Sets the VOUT under-voltage fault threshold	Vout Mode Unsigned	V

**VOUT\_UV\_FAULT\_RESPONSE (0x45)**

Transfer Type: R/W Byte

Description: Sets the VOUT UV LIMIT Response.

Bit	Function	Description	Value	Function	Description
7:6	Response	Describes the device interruption operation. For all modes set by bits [7:6], the device pulls SALERT low and sets the related fault bit in the status registers.	10	Disable and Retry	Disable the output without delay and retry according to the setting in bits [5:3].

**IOUT\_OC\_FAULT\_LIMIT (0x46)**

Transfer Type: R/W Word

Description: Sets the output over-current peak limit.

Bit	Description	Format	Unit
15:0	Sets the IOUT overcurrent peak fault threshold for each phase, i.e. either phase can trigger an overcurrent fault. Thus, the effective fault threshold will be twice the value of this command.	Linear	A

**IOUT\_UC\_FAULT\_LIMIT (0x4B)**

Transfer Type: R/W Word

Description: Sets the output under-current peak limit.

Bit	Description	Format	Unit
15:0	Sets the IOUT undercurrent peak fault threshold for each phase, i.e. either phase can trigger an undercurrent fault. Thus, the effective fault threshold will be twice the value of this command.	Linear	A

**OT\_FAULT\_LIMIT (0x4F)**

Transfer Type: R/W Word

Description: Sets the over-temperature fault limit.

Bit	Description	Format	Unit
15:0	Sets the over-temperature fault threshold.	Linear	°C

**OT\_FAULT\_RESPONSE (0x50)**

Transfer Type: R/W Byte

Description: Sets the over-temperature fault response.

Bit	Function	Description	Value	Function	Description
7:6	Response	Describes the device interruption operation. For all modes set by bits [7:6], the device pulls SALERT low and sets the related fault bit in the status registers.	10	Disable and Retry	Disable the output without delay and retry according to the setting in bits [5:3].

**OT\_WARN\_LIMIT (0x51)**

Transfer Type: R/W Word

Description: Sets the over-temperature warning limit.

Bit	Description	Format	Unit
15:0	Sets the over-temperature warning threshold.	Linear	°C

**UT\_WARN\_LIMIT (0x52)**

Transfer Type: R/W Word

Description: Sets the under-temperature warning limit.

Bit	Description	Format	Unit
15:0	Sets the undertemperature warning threshold.	Linear	°C

**UT\_FAULT\_LIMIT (0x53)**

Transfer Type: R/W Word

Description: Sets the under-temperature fault limit.

Bit	Description	Format	Unit
15:0	Sets the undertemperature fault threshold.	Linear	°C

**UT\_FAULT\_RESPONSE (0x54)**

Transfer Type: R/W Byte

Description: Sets the under-temperature fault response.

Bit	Function	Description	Value	Function	Description
7:6	Response	Describes the device interruption operation. For all modes set by bits [7:6], the device pulls SALERT low and sets the related fault bit in the status registers.	10	Disable and Retry	Disable the output without delay and retry according to the setting in bits [5:3].
5:3	Retry Setting	The device attempts to restart the number of times set by these bits.	000	Do Not Retry	A zero value for the Retry Setting means that the unit does not attempt to restart. The output remains disabled until the fault is cleared.

**BMR465 Series PoL Regulators**  
 Input 7.5 - 14 V, Output up to 90 A / 162 W

28701 - BMR 465 Rev. D

March 2016

© Ericsson AB

Bit	Function	Description	Value	Function	Description
			111	Retry Continuously	The PMBus device attempts to restart continuously, without limitation, until output is DISABLED, bias power is removed, or another fault condition causes the output to shut down.
2:0	Retry Time	Retry delay time = (Value +1) * 35 ms. Sets the time between retries in 35 ms increments. Range is 35 ms to 280 ms.	000	35 ms	
			001	70 ms	
			010	105 ms	
			011	140 ms	
			100	175 ms	
			101	210 ms	
			110	245 ms	
			111	280 ms	

**VIN\_OV\_FAULT\_LIMIT (0x55)**

Transfer Type: R/W Word

Description: Sets the input over-voltage fault limit.

Bit	Description	Format	Unit
15:0	Sets the VIN overvoltage fault threshold.	Linear	V

**VIN\_OV\_FAULT\_RESPONSE (0x56)**

Transfer Type: R/W Byte

Description: Sets the input over-voltage fault response.

Bit	Function	Description	Value	Function	Description
7:6	Response	Describes the device interruption operation. For all modes set by bits [7:6], the device pulls SALERT low and sets the related fault bit in the status registers.	10	Disable and Retry	Disable the output without delay and retry according to the setting in bits [5:3].
5:3	Retry Setting	The device attempts to restart the number of times set by these bits.	000	Do Not Retry	A zero value for the Retry Setting means that the unit does not attempt to restart. The output remains disabled until the fault is cleared.

**VIN\_OV\_WARN\_LIMIT (0x57)**

Transfer Type: R/W Word

Description: Sets the input over-voltage warning limit.

Bit	Description	Format	Unit
15:0	Sets the VIN overvoltage warning threshold.	Linear	V

**BMR465 Series PoL Regulators**  
 Input 7.5 - 14 V, Output up to 90 A / 162 W

28701 - BMR 465 Rev. D

March 2016

© Ericsson AB

**VIN\_UV\_WARN\_LIMIT (0x58)**

Transfer Type: R/W Word

Description: Sets the input under-voltage warning limit.

Bit	Description	Format	Unit
15:0	Sets the VIN undervoltage warning threshold.	Linear	V

**VIN\_UV\_FAULT\_LIMIT (0x59)**

Transfer Type: R/W Word

Description: Sets the input under-voltage fault limit.

Bit	Description	Format	Unit
15:0	Sets the VIN undervoltage fault threshold.	Linear	V

**VIN\_UV\_FAULT\_RESPONSE (0x5A)**

Transfer Type: R/W Byte

Description: Sets the input under-voltage fault response.

Bit	Function	Description	Value	Function	Description
7:6	Response	Describes the device interruption operation. For all modes set by bits [7:6], the device pulls SALERT low and sets the related fault bit in the status registers.	10	Disable and Retry	Disable the output without delay and retry according to the setting in bits [5:3].

111	280 ms				

**POWER\_GOOD\_ON (0x5E)**

Transfer Type: R/W Word

Description: Sets the output voltage threshold for asserting PG (Power Good).

Bit	Description	Format	Unit
15:0	Sets the output voltage threshold for asserting PG (Power Good).	Vout Mode Unsigned	V

**TON\_DELAY (0x60)**

Transfer Type: R/W Word

Description: Sets the turn-on delay time

Bit	Description	Format	Unit
15:0	Sets the delay time from ENABLE to start of the rise of the output voltage. The time can range from 3 ms up to 250 ms.	Linear	ms

**BMR465 Series PoL Regulators**  
 Input 7.5 - 14 V, Output up to 90 A / 162 W

28701 - BMR 465 Rev. D

March 2016

© Ericsson AB

**TON\_RISE (0x61)**

Transfer Type: R/W Word

Description: Sets the turn-on ramp-up time.

Bit	Description	Format	Unit
15:0	Sets the rise time of VOUT after ENABLE and On Delay. The time can range from 0 ms to 100 ms.	Linear	ms

**TOFF\_DELAY (0x64)**

Transfer Type: R/W Word

Description: Sets the turn-off delay.

Bit	Description	Format	Unit
15:0	Sets the delay time from DISABLE to start of the fall of the output voltage. Normally the time can range from 4 ms up to 250 ms. A value of 0 ms can be set to guarantee a fast shut-off, but this will force the device to Immediate Off behaviour, even if soft-off, i.e. ramp-down, is configured (in ON_OFF_CONFIG).	Linear	ms

**TOFF\_FALL (0x65)**

Transfer Type: R/W Word

Description: Sets the turn-off ramp-down time.

Bit	Description	Format	Unit
15:0	Sets the fall time for VOUT after DISABLE and Off Delay. The time can range from 0 ms to 100 ms.	Linear	ms

**STATUS\_BYTE (0x78)**

Transfer Type: Read Byte

Description: Returns a brief fault/warning status byte.

Bit	Function	Description	Value	Description
7	Busy	A fault was declared because the device was busy and unable to respond.	0	No fault
			1	Fault
6	Off	This bit is asserted if the unit is not providing power to the output, regardless of the reason, including simply not being enabled.	0	No fault
			1	Fault
5	Vout Overvoltage Fault	An output overvoltage fault has occurred.	0	No fault
			1	Fault
4	Iout Overcurrent Fault	An output overcurrent fault has occurred.	0	No fault
			1	Fault
3	Vin Undervoltage Fault	An input undervoltage fault has occurred.	0	No fault
			1	Fault
2	Temperature	A temperature fault or warning has occurred.	0	No fault
			1	Fault
1	Communication/Logic	A communications, memory or logic fault has occurred.	0	No fault
			1	Fault

**STATUS\_WORD (0x79)**

Transfer Type: Read Word

Description: Returns an extended fault/warning status byte.

Bit	Function	Description	Value	Description
15	Vout	An output voltage fault or warning has occurred.	0	No fault
			1	Fault
14	Iout	An output current fault or warning has occurred.	0	No Fault.
			1	Fault.
13	Input	An input voltage, input current, or input power fault or warning has occurred.	0	No Fault.
			1	Fault.
12	Mfr	A manufacturer specific fault or warning has	0	No Fault.

**BMR465 Series PoL Regulators**  
 Input 7.5 - 14 V, Output up to 90 A / 162 W

28701 - BMR 465 Rev. D

March 2016

© Ericsson AB

Bit	Function	Description	Value	Description
		occurred.	1	Fault.
11	Power-Good	The Power-Good signal, if present, is negated.	0	No Fault.
			1	Fault.
9	Other	A bit in STATUS_VOUT, STATUS_IOUT, STATUS_INPUT, STATUS_TEMPERATURE, STATUS_CML or STATUS_MFR_SPECIFIC is set.	0	No Fault.
			1	Fault.
7	Busy	A fault was declared because the device was busy and unable to respond.	0	No Fault.
			1	Fault.
6	Off	This bit is asserted if the unit is not providing power to the output, regardless of the reason, including simply not being enabled.	0	No Fault.
			1	Fault.
5	Vout Overvoltage Fault	An output overvoltage fault has occurred.	0	No Fault.
			1	Fault.
4	Iout Overcurrent Fault	An output overcurrent fault has occurred.	0	No Fault.
			1	Fault.
3	Vin Undervoltage Fault	An input undervoltage fault has occurred.	0	No Fault.
			1	Fault.
2	Temperature	A temperature fault or warning has occurred.	0	No Fault.
			1	Fault.
1	Communication/Logic	A communications, memory or logic fault has occurred.	0	No fault.
			1	Fault.

**STATUS\_VOUT (0x7A)**

Transfer Type: Read Byte

Description: Returns Vout-related fault/warning status bits.

Bit	Function	Description	Value	Description
7	Vout Overvoltage Fault	Vout Overvoltage Fault.	0	No Fault.
			1	Fault.
4	Vout Undervoltage Fault	Vout Undervoltage Fault.	0	No Fault.
			1	Fault.

**STATUS\_IOUT (0x7B)**

Transfer Type: Read Byte

Description: Returns Iout-related fault/warning status bits.

Bit	Function	Description	Value	Description
7	Iout Overcurrent Fault	Iout Overcurrent Fault.	0	No Fault.
			1	Fault.
4	Iout Undercurrent Fault	Iout Undercurrent Fault.	0	No Fault.
			1	Fault.

**STATUS\_INPUT (0x7C)**

Transfer Type: Read Byte

Description: Returns VIN/IIN-related fault/warning status bits.

Bit	Function	Description	Value	Description
7	Vin Overvoltage Fault	Vin Overvoltage Fault.	0	No Fault.
			1	Fault.
6	Vin Overvoltage Warning	VIN Overvoltage Warning.	0	No Warning.
			1	Warning.
5	Vin Undervoltage Warning	Vin Undervoltage Warning.	0	No Warning.
			1	Warning.
4	Vin Undervoltage Fault	Vin Undervoltage Fault.	0	No Fault.
			1	Fault.

**STATUS\_TEMPERATURE (0x7D)**

Transfer Type: Read Byte

Description: Returns the temperature-related fault/warning status bits

**BMR465 Series PoL Regulators**  
 Input 7.5 - 14 V, Output up to 90 A / 162 W

28701 - BMR 465 Rev. D

March 2016

Bit	Function	Description	Value	Description
7	Overtemperature Fault	Overtemperature Fault.	0	No Fault.
			1	Fault.
6	Overtemperature Warning	Overtemperature Warning.	0	No Warning.
			1	Warning.
5	Undertemperature Warning	Undertemperature Warning.	0	No Warning.
			1	Warning.
4	Undertemperature Fault	Undertemperature Fault.	0	No Fault.
			1	Fault.
3	Internal Temp Sensor Fault	A warning or fault occurred from the internal temperature sensor.	0	No Fault.
			1	Fault.
2	External Temp Sensor 0 Fault	A warning or fault occurred from the external temperature sensor 0 (not used).	0	No Fault.
			1	Fault.
1	External Temp Sensor 1 Fault	A warning or fault occurred from the external temperature sensor 1 (not used).	0	No Fault.
			1	Fault.

**STATUS\_CML (0x7E)**

Transfer Type: Read Byte

Description: Returns Communication/Logic/Memory-related fault/warning status bits.

Bit	Function	Description	Value	Description
7	Invalid Or Unsupported Command Received	Invalid Or Unsupported Command Received.	0	No Invalid Command Received.
			1	Invalid Command Received.
6	Invalid Or Unsupported Data Received	Invalid Or Unsupported Data Received.	0	No Invalid Data Received.
			1	Invalid Data Received.
5	Packet Error Check Failed	Packet Error Check (PEC) Failed.	0	No Failure.
			1	Failure.
3	CRC Fault	A CRC fault was detected.	0	No Fault.
			1	Fault.
2	CPU Fault	A CPU fault was detected.	0	No Fault.
			1	Fault.
1	Other Communication Fault	A PMBus command tried to write to a read-only or protected command, or a communication fault other than the ones listed in this table has occurred.	0	No Fault.
			1	Fault.

**STATUS\_MFR\_SPECIFIC (0x80)**

Transfer Type: Read Byte

Description: Returns manufacturer specific status information.

Bit	Function	Description	Value	Description
7	Multi phase init error	A phase or phases of a multi-phase current sharing group did not initialize.	0	No Fault.
			1	Fault.
6	GCB fault	An error occurred in GCB communication	0	No Fault.
			1	Fault.
5	VMON UV warning	VMON under voltage warning. The warning limit is 110% of the configured VMON UV fault limit.	0	No Fault.
			1	Fault.
4	VMON OV warning	VMON over voltage warning. The warning limit is 95% of the configured VMON OV fault limit.	0	No Fault.
			1	Fault.
3	Clock Fail/Loss of sync	External Switching Period Fault (TSW); indicates loss of external SYNC clock.	0	No Fault.
			1	Fault.
2	Group fault	A rail in the fault group has failed.	0	No Fault.
			1	Fault.
1	VMON UV fault	VMON under voltage fault	0	No Fault.
			1	Fault.
0	VMON OV fault	VMON over voltage fault.	0	No Fault.
			1	Fault.

**READ\_VIN (0x88)**

Transfer Type: Read Word

Description: Returns the measured input voltage.

Bit	Description	Format	Unit
15:0	Returns the input voltage reading.	Linear	V

**READ\_VOUT (0x8B)**

Transfer Type: Read Word

Description: Returns the measured output voltage.

Bit	Description	Format	Unit
15:0	Returns the measured output voltage.	Vout Mode Unsigned	V

**READ\_IOUT (0x8C)**

Transfer Type: Read Word

Description: Returns the measured output current.

Bit	Description	Format	Unit
15:0	Returns the output current reading. The device will NACK this command when not enabled and not in the USER_CONFIG monitor mode.	Linear	A

**READ\_TEMPERATURE\_1 (0x8D)**

Transfer Type: Read Word

Description: Returns the measured temperature (internal).

Bit	Description	Format	Unit
15:0	Returns the measured temperature of internal sensor.	Linear	°C

**READ\_TEMPERATURE\_2 (0x8E)**

Transfer Type: Read Word

Description: Returns the measured temperature of external sensor 0 (not used).

Bit	Description	Format	Unit
15:0	Returns the measured temperature of external sensor 0 (not used).	Linear	°C

**READ\_TEMPERATURE\_3 (0x8F)**

Transfer Type: Read Word

Description: Returns the measured temperature of external sensor 1 (not used).

Bit	Description	Format	Unit
15:0	Returns the measured temperature of external sensor 1 (not used).	Linear	°C

**READ\_DUTY\_CYCLE (0x94)**

Transfer Type: Read Word

Description: Returns the measured duty cycle in percent.

Bit	Description	Format	Unit
15:0	Returns the target duty cycle during the ENABLE state. The device will NACK this command when not enabled and not in the USER_CONFIG monitor mode.	Linear	%

**READ\_FREQUENCY (0x95)**

Transfer Type: Read Word

Description: Returns the measured switching frequency.

Bit	Description	Format	Unit
15:0	Returns the measured operating switch frequency.	Linear	kHz

**BMR465 Series PoL Regulators**  
 Input 7.5 - 14 V, Output up to 90 A / 162 W

28701 - BMR 465 Rev. D March 2016

© Ericsson AB

**PMBUS\_REVISION (0x98)**

Transfer Type: Read Byte

Description: Returns the PMBus revision number for this device.

Bit	Function	Description	Value	Function	Description
7:4	Part I Revision	Part I Revision.	0000	1.0	Part I Revision 1.0.
			0001	1.1	Part I Revision 1.1.
			0010	1.2	Part I Revision 1.2.
3:0	Part II Revision	Part II Revision.	0000	1.0	Part II Revision 1.0.
			0001	1.1	Part II Revision 1.1.
			0010	1.2	Part II Revision 1.2.

**MFR\_ID (0x99)**

Transfer Type: R/W Block (22 bytes)

Description: Sets the manufacturer ID String.

Bit	Description	Format
21:0	Maximum of 22 characters.	ASCII

**MFR\_MODEL (0x9A)**

Transfer Type: R/W Block (14 bytes)

Description: Sets the manufacturer model string.

Bit	Description	Format
13:0	Maximum of 14 characters.	ASCII

**MFR\_REVISION (0x9B)**

Transfer Type: R/W Block (24 bytes)

Description: Sets the manufacturer revision string.

Bit	Description	Format
23:0	Maximum of 24 characters.	ASCII

**MFR\_LOCATION (0x9C)**

Transfer Type: R/W Block (7 bytes)

Description: Sets the manufacturer location string.

Bit	Description	Format
6:0	Maximum of 7 characters.	ASCII

**MFR\_DATE (0x9D)**

Transfer Type: R/W Block (10 bytes)

Description: Sets the manufacturer date at YYMMDD.

Bit	Description	Format
9:0	Maximum of 10 characters.	ASCII

**MFR\_SERIAL (0x9E)**

Transfer Type: R/W Block (13 bytes)

Description: Sets the manufacturer serial string.

Bit	Description	Format
12:0	Maximum of 13 characters.	ASCII

**IC\_DEVICE\_ID (0xAD)**

Transfer Type: Read Block (4 bytes)

Description:

Bit	Description	Format
-----	-------------	--------

<b>BMR465 Series PoL Regulators</b> Input 7.5 - 14 V, Output up to 90 A / 162 W	28701 - BMR 465 Rev. D	March 2016
	© Ericsson AB	

Bit	Description	Format
3:0		ASCII fixed length

**IC\_DEVICE\_REV (0xAE)**

Transfer Type: Read Block (4 bytes)

Description:

Bit	Description	Format
3:0		ASCII fixed length

**USER\_DATA\_00 (0xB0)**

Transfer Type: R/W Block (23 bytes)

Description: Sets a user defined data string.

Bit	Description	Format
22:0	Maximum of 23 characters.	ASCII

**USER\_DATA\_01 (0xB1)**

Transfer Type: R/W Block (8 bytes)

Description: Sets a user defined data string. This is a fixed length command with dedicated 8 bytes. If the string is shorter than 8 characters the program will fill with zero data up to 8 bytes.

Bit	Description	Format
7:0	Maximum of 8 characters.	ASCII fixed length

**DEADTIME\_MAX (0xBF)**

Transfer Type: R/W Word

Description: Sets the maximum deadtime value for the adaptive deadtime algorithm.

Bit	Function	Description	Format	Unit
14:8	Deadtime max	Value 0 to 60 ns. Maximum allowed H-L (high-side to low-side) deadtime.	Integer Signed	ns
6:0	Deadtime max	Value 0 to 60 ns. Maximum allowed L-H (low-side to high-side) deadtime.	Integer Signed	ns

**IOUT0\_CAL\_GAIN (0xCA)**

Transfer Type: R/W Word

Description: Sets the current sense resistance for phase 0.

Bit	Description	Format	Unit
15:0	Sets the effective impedance for phase 0 current sensing at +25°C.	Linear	mΩ

**IOUT1\_CAL\_GAIN (0xCB)**

Transfer Type: R/W Word

Description: Sets the current sense resistance for phase 1.

Bit	Description	Format	Unit
15:0	Sets the effective impedance for phase 1 current sensing at +25°C.	Linear	mΩ

**IOUT0\_CAL\_OFFSET (0xCC)**

Transfer Type: R/W Word

Description: Sets the current-sense offset for phase 0.

Bit	Description	Format	Unit
15:0	Sets an offset to phase 0 IOUT readings. Use to compensate for delayed measurements of current ramp.	Linear	A

**BMR465 Series PoL Regulators**  
 Input 7.5 - 14 V, Output up to 90 A / 162 W

28701 - BMR 465 Rev. D March 2016

© Ericsson AB

**IOUT1\_CAL\_OFFSET (0xCD)**

Transfer Type: R/W Word

Description: Sets the current-sense offset for phase 1.

Bit	Description	Format	Unit
15:0	Sets an offset to phase 1 IOUT readings. Use to compensate for delayed measurements of current ramp.	Linear	A

**MIN\_VOUT\_REG (0xCE)**

Transfer Type: R/W Word

Description: Minimum regulation voltage.

Bit	Description	Format	Unit
15:0	Sets the minimum output voltage that the device will attempt to regulate to during start-up and shut-down ramps.	Linear	mV

**ISENSE\_CONFIG (0xD0)**

Transfer Type: R/W Word

Description: Configures the current sense circuitry.

Bit	Function	Description	Value	Function	Description
15:11	Current Sense Blanking Delay	Sets the current sense blanking time (i.e. the time after switch transition before current measurement starts) in increments of 32ns.	00000	0 ns	
			00001	32 ns	
			00010	64 ns	
			00011	96 ns	
			00100	128 ns	
			00101	160 ns	
			00110	192 ns	
			00111	224 ns	
			01000	256 ns	
			01001	288 ns	
			01010	320 ns	
			01011	352 ns	
			01100	384 ns	
			01101	416 ns	
			01110	448 ns	
			01111	480 ns	
			10:8	Current Sense Fault Count	Sets the number of consecutive over-current (OC) or under-current (UC) events required for a fault. An event can occur once during each switching cycle. For example, if 5 is selected, an OC or UC event must occur for 5 consecutive switching cycles, resulting in a delay of at least 5 switching periods.
001	3				
010	5				
011	7				
100	9				
101	11				
110	13				
3:2	Current Sense Control	Selection of DCR current sensing method across inductor.	01	DCR Down Slope	Measurements at down slope of ripple current.

**BMR465 Series PoL Regulators**  
 Input 7.5 - 14 V, Output up to 90 A / 162 W

28701 - BMR 465 Rev. D

March 2016

© Ericsson AB

Bit	Function	Description	Value	Function	Description
			10	DCR Up Slope	Measurements at up slope of ripple current.
1:0	Current Sense Range	Sets the range of the current sense ADC.	00	Low range $\pm 25$ mV	
			01	Mid range $\pm 35$ mV	
			10	High range $\pm 50$ mV	

**USER\_CONFIG (0xD1)**

Transfer Type: R/W Word

Description: Sets misc. device configurations.

Bit	Function	Description	Format
15:11	Minimum Duty Cycle	Value 0-31. Sets the minimum duty cycle to $2 \times (\text{value} + 1) / 512 \times T_{sw}$ when enabled by Bit 7 ( $T_{sw}$ = switching period).	Integer Unsigned

Bit	Function	Description	Value	Function	Description
10	Power device drive	Enable or disable power device drive.	1		Power device drive is enabled.
			0		Power device drive is disabled.
7	Min. Duty Cycle Control	Enable or disable minimum duty cycle.	1		Minimum Duty Cycle Enabled.
			0		Minimum Duty Cycle Disabled.
2	PG Pin Output Control	PG Pin Output Control.	0	Open-Drain	PG is open-drain
			1	Push-Pull	PG is push-pull
1	Ext. Temp Sense	Enable or disable external temperature sensor (not used). When enabled it will be used for temp compensation of read current.	1		External temperature sensor enabled.
			0		External temperature sensor disabled.
0	Ext. Temp Sense for Faults	Selects external temperature sensor to determine temperature faults (not used).	1		Select external temperature sensor.
			0		Do not select external temperature sensor (internal sensor is used).

**GCB\_CONFIG (0xD3)**

Transfer Type: R/W Word

Description: Configures the Group Communication Bus addressing and current sharing.

Bit	Function	Description	Format
12:8	GCB/Rail ID	Value 0-31. Sets the rail's GCB ID for current sharing, sequencing and fault spreading. All devices within a current sharing group must be assigned the same GCB ID.	Integer Unsigned

Bit	Function	Description	Value	Function	Description
15:13	Phase ID	Value 0-3. Sets a device's position within a current sharing group (-1).	00	Position 1	
			01	Position 2	
			10	Position 3	
			11	Position 4	
3:0	Phases in rail	Value 1, 3, 5 or 7. Identifies the number of phases on the same rail.	001	2 phases	
			011	4 phases	
			101	6 phases	
			111	8 phases	

**POWER\_GOOD\_DELAY (0xD4)**

Transfer Type: R/W Word

Description: Sets the Power-Good delay time.

Bit	Description	Format	Unit
-----	-------------	--------	------

<b>BMR465 Series PoL Regulators</b> Input 7.5 - 14 V, Output up to 90 A / 162 W	28701 - BMR 465 Rev. D	March 2016
	© Ericsson AB	

Bit	Description	Format	Unit
15:0	Sets the delay applied between the output exceeding the PG threshold (POWER_GOOD_ON) and asserting the PG pin. The delay time can range from 0 ms up to 5000 ms. Inside the device, the set value will be rounded to closest integer value.	Linear	ms

#### MULTI\_PHASE\_RAMP\_GAIN (0xD5)

Transfer Type: R/W Byte

Description: This command value indirectly determines the output voltage rise time for current sharing rails. Typical gain values range from 1 to 5. Lower gain values produce longer ramp times. This ramp mode is automatically selected when the product is configured for current sharing. When in current sharing ramp mode, the normal high bandwidth turn-on ramp is disabled, resulting in a lower loop bandwidth during start-up ramps. Large load current transitions during multi-phase ramp-ups will cause output voltage discontinuities. Once Power Good has been asserted, the normal high bandwidth control loop is enabled and the product operates normally. When in a current sharing setup, Soft Off ramps are not allowed (TOFF\_FALL is ignored).

Bit	Description	Format
7:0	Current sharing ramp-up gain value.	Integer Unsigned

#### INDUCTOR (0xD6)

Transfer Type: R/W Word

Description: Informs the device of circuit's inductor value.

Bit	Description	Format	Unit
15:0	This is used in adaptive algorithm calculations relating to the inductor ripple current. Range is 0-100 $\mu$ H.	Linear	$\mu$ H

#### SNAPSHOT\_FAULT\_MASK (0xD7)

Transfer Type: R/W Word

Description: Masking for which faults will trigger a snapshot NVM write.

Bit	Function	Description	Value	Description
13	Group fault	Block fault from when a rail in your fault group has faulted.	1	Trigger blocked
			0	Trigger enabled
12	Phase fault	Block fault from when a phase in your rail has faulted.	1	Trigger blocked
			0	Trigger enabled
11	CPU fault	Block general purpose CPU fault.	1	Trigger blocked
			0	Trigger enabled
10	CRC fault	Block memory CRC fault	1	Trigger blocked
			0	Trigger enabled
9	VMON UV fault	Block VMON under voltage fault	1	Trigger blocked
			0	Trigger enabled
8	VMON OV fault	Block VMON over voltage fault	1	Trigger blocked
			0	Trigger enabled
7	Iout UC fault	Block output under current fault	1	Trigger blocked
			0	Trigger enabled
6	Iout OC fault	Block output over current fault	1	Trigger blocked
			0	Trigger enabled
5	Vin UV fault	Block input under voltage fault	1	Trigger blocked
			0	Trigger enabled
4	Vin OV fault	Block input over voltage fault	1	Trigger blocked
			0	Trigger enabled
3	UT fault	Block under temperature fault	1	Trigger blocked
			0	Trigger enabled
2	OT fault	Block over temperature fault	1	Trigger blocked
			0	Trigger enabled
1	Vout UV fault	Block output under voltage fault	1	Trigger blocked
			0	Trigger enabled
0	Vout OV fault	Block output over voltage fault	1	Trigger blocked
			0	Trigger enabled

**BMR465 Series PoL Regulators**  
 Input 7.5 - 14 V, Output up to 90 A / 162 W

28701 - BMR 465 Rev. D

March 2016

**OVUV\_CONFIG (0xD8)**

Transfer Type: R/W Byte

Description: Sets output OV/UV control features.

Bit	Function	Description	Format
3:0	No Of Limit Violations	Value 0-15. Value + 1 consecutive OV or UV violations to initiate a fault response.	Integer Unsigned

Bit	Function	Description	Value	Description
7	Low-Side OV Fault Control (Crowbar)	Control of low-side power switch after an Over Voltage fault.	0	An OV fault does not enable the low-side power device.
			1	An OV fault enables the low-side power device.

**XTEMP\_SCALE (0xD9)**

Transfer Type: R/W Word

Description: Scale for external temp sensor (not used).

Bit	Description	Format
15:0	The constant is applied to the equation $READ\_TEMPERATURE\_2/3 = ExternalTemperature / XTEMP\_SCALE + XTEMP\_OFFSET$ to produce the read value via the PMBus command $READ\_TEMPERATURE\_2/3$ .	Linear

**XTEMP\_OFFSET (0xDA)**

Transfer Type: R/W Word

Description: Offset for external temp sensor (not used).

Bit	Description	Format	Unit
15:0	The constant is applied to the equation $READ\_TEMPERATURE\_2/3 = ExternalTemperature / XTEMP\_SCALE + XTEMP\_OFFSET$ to produce the read value via the PMBus command $READ\_TEMPERATURE\_2/3$ .	Linear	°C

**MFR\_SMBALERT\_MASK (0xDB)**

Transfer Type: R/W Block (7 bytes)

Description: Masking of which warning or fault indications that will trigger an assertion of the SALERT signal output. Each byte corresponds to masking of one status command according to: Byte 0: Mask of STATUS\_VOUT [7:0] Byte 1: Mask of STATUS\_IOUT [7:0] Byte 2: Mask of STATUS\_INPUT [7:0] Byte 3: Mask of STATUS\_TEMPERATURE [7:0] Byte 4: Mask of STATUS\_CML [7:0] Byte 5: Mask of STATUS\_OTHER[7:0] Byte 6: Mask of STATUS\_MFR\_SPECIFIC [7:0]

Bit	Function	Description	Value	Description
55	Multi phase init error	A phase or phases of a multi-phase current sharing group did not initialize.	1	Trigger blocked
			0	Trigger enabled
54	GCB fault	An error occurred in GCB communication	1	Trigger blocked
			0	Trigger enabled
53	VMON UV warning	VMON under voltage warning. The warning limit is 110% of the configured VMON UV fault limit.	1	Trigger blocked
			0	Trigger enabled
52	VMON OV warning	VMON over voltage warning. The warning limit is 95% of the configured VMON OV fault limit.	1	Trigger blocked
			0	Trigger enabled
51	Clock Fail/Loss of sync	External Switching Period Fault (TSW); indicates loss of external SYNC clock.	1	Trigger blocked
			0	Trigger enabled
50	Rail fault in group	One of the rails in your group faulted	1	Trigger blocked
			0	Trigger enabled
49	VMON UV fault	VMON under voltage fault	1	Trigger blocked
			0	Trigger enabled
48	VMON OV fault	VMON over voltage fault	1	Trigger blocked
			0	Trigger enabled
39	Invalid Or Unsupported Command Received	Invalid Or Unsupported Command Received.	1	Trigger blocked
			0	Trigger enabled

**BMR465 Series PoL Regulators**  
 Input 7.5 - 14 V, Output up to 90 A / 162 W

28701 - BMR 465 Rev. D

March 2016

© Ericsson AB

Bit	Function	Description	Value	Description
38	Invalid Or Unsupported Data Received	Invalid Or Unsupported Data Received.	1	Trigger blocked
			0	Trigger enabled
37	Packet Error Check Failed	Packet Error Check Failed.	1	Trigger blocked
			0	Trigger enabled
33	Other Communication Fault	A PMBus command tried to write to a read-only or protected command, or a communication fault other than the ones listed in this table has occurred.	1	Trigger blocked
			0	Trigger enabled
31	Overtemperature Fault	Overtemperature Fault.	1	Trigger blocked
			0	Trigger enabled
30	Overtemperature Warning	Overtemperature Warning.	1	Trigger blocked
			0	Trigger enabled
29	Undertemperature Warning	Undertemperature Warning.	1	Trigger blocked
			0	Trigger enabled
28	Undertemperature Fault	Undertemperature Fault.	1	Trigger blocked
			0	Trigger enabled
27	Internal Temp Sensor Fault	A warning or fault occurred from the internal temperature sensor.	1	Trigger blocked
			0	Trigger enabled
26	External Temp Sensor 0 Fault	A warning or fault occurred from the external temperature sensor 0.	1	Trigger blocked
			0	Trigger enabled
25	External Temp Sensor 1 Fault	A warning or fault occurred from the external temperature sensor 1.	1	Trigger blocked
			0	Trigger enabled
23	Vin Overvoltage Fault	Vin Overvoltage Fault.	1	Trigger blocked
			0	Trigger enabled
22	Vin Overvoltage Warning	VIN Overvoltage Warning.	1	Trigger blocked
			0	Trigger enabled
21	Vin Undervoltage Warning	Vin Undervoltage Warning.	1	Trigger blocked
			0	Trigger enabled
20	Vin Undervoltage Fault	Vin Undervoltage Fault.	1	Trigger blocked
			0	Trigger enabled
15	Iout Overcurrent Fault	Iout Overcurrent Fault.	1	Trigger blocked
			0	Trigger enabled
12	Iout Undercurrent Fault	Iout Undercurrent Fault.	1	Trigger blocked
			0	Trigger enabled
11	Iout fault on Phase 0	Iout fault on Phase 0	1	Trigger blocked
			0	Trigger enabled
10	Iout fault on Phase 1	Iout fault on Phase 1	1	Trigger blocked
			0	Trigger enabled
7	Vout Overvoltage Fault	Vout Overvoltage Fault.	1	Trigger blocked
			0	Trigger enabled
4	Vout Undervoltage Fault	Vout Undervoltage Fault.	1	Trigger blocked
			0	Trigger enabled

**TEMPCO\_CONFIG (0xDC)**

Transfer Type: R/W Byte

Description: Temp correction factor for measured output current.

Bit	Function	Description	Format	Unit
6:0	Isense Temperature Correction	Configures the correction factor TC for output current sense. When using external temperature sensors, the coefficient applies to both temperature sensors. $RSEN (DCR) = IOUT\_CAL\_GAIN \times (1 + TC \times (T - 25))$ where $RSEN =$ resistance of sense element.	Integer Unsigned	x 100p pm/°C

Bit	Function	Description	Value	Function	Description
7	Temperature correction source	Selects the temperature sensor source for current sense temp correction. (To use the external temp sensor it must be enabled in USER_CONFIG).	0	Internal temp sensor	Selects the internal temperature sensor.
			1	External temp sensor	Selects the external temperature sensors.

**BMR465 Series PoL Regulators**  
 Input 7.5 - 14 V, Output up to 90 A / 162 W

28701 - BMR 465 Rev. D

March 2016

© Ericsson AB

**DEADTIME (0xDD)**

Transfer Type: R/W Word

Description: Configures power switch dead times.

Bit	Function	Description	Format	Unit
15:8	Deadtime H-L	Value -10 to 60 ns. Controls the high-side to low-side deadtime value. Positive values imply a non-overlap of the FET drive on-times. Negative values imply an overlap of the FET drive on-times. The default value of the maximum deadtime for the adaptive deadtime algorithm is 60ns. Writing a value to this command immediately before writing the DEADTIME_CONFIG command will set a new maximum for the adaptive deadtime algorithm. The device will operate at the deadtime values written to this command when adaptive deadtime is disabled.	Integer Signed	ns
7:0	Deadtime L-H	Value -10 to 60 ns. Controls the low-side to high-side deadtime value. Positive values imply a non-overlap of the FET drive on-times. Negative values imply an overlap of the FET drive on-times. Writing a value to this command immediately before writing the DEADTIME_CONFIG command will set a new maximum for the adaptive deadtime algorithm. The device will operate at the deadtime values written to this command when adaptive deadtime is disabled.	Integer Signed	ns

**DEADTIME\_CONFIG (0xDE)**

Transfer Type: R/W Word

Description: Configures the deadtime optimization mode.

Bit	Function	Description	Format	Unit
14:8	Min Deadtime H-L	Value -5 to 28 ns. Limits the minimum allowed H-to-L deadtime for adaptive algorithm to value x 2 ns (signed).	Integer Signed	x 2ns
6:0	Min. L-H Deadtime	Value -5 to 28 ns. Limits the minimum allowed L-to-H deadtime for adaptive algorithm to value x 2ns (signed).	Integer Signed	x 2ns

Bit	Function	Description	Value	Function	Description
15	H-L Deadtime Mode	Selects adaptive or fixed H-to-L dead time.	0	Adaptive	Adaptive H-to-L deadtime control.
			1	Freeze	Freeze the H-to-L deadtime.
7	L-H Deadtime Mode	Selects adaptive or fixed L-to-H dead time.	0	Adaptive	Adaptive L-to-H deadtime control.
			1	Freeze	Freeze the L-to-H deadtime.

**ASCR\_CONFIG (0xDF)**

Transfer Type: R/W Block (4 bytes)

Description: Control loop settings

Bit	Function	Description	Format
23:16	ASCR Residual	Residual factor	Integer Unsigned
15:0	ASCR Gain	Gain factor	Integer Unsigned

Bit	Function	Description	Value	Description
24	ASCR Enable	Enable or disable the ASCR function.	1	ASCR enabled
			0	ASCR disabled

**SEQUENCE (0xE0)**

Transfer Type: R/W Word

Description: The device will enable its output when its CTRL or OPERATION enable state, as defined by ON\_OFF\_CONFIG, is set and the prequel device has issued a Power-Good event on the GCB bus. The device will disable its output (using the programmed delay values) when the sequel device has issued a Power-Down event on the GCB bus. The data field is a two-byte value. The most-significant byte contains the 5-bit Rail GCB ID of the prequel device. The least-significant byte contains the 5-bit Rail GCB ID of the sequel device. The most significant bit of each byte contains the enable of the prequel or sequel mode.

**BMR465 Series PoL Regulators**  
 Input 7.5 - 14 V, Output up to 90 A / 162 W

28701 - BMR 465 Rev. D March 2016

© Ericsson AB

Bit	Function	Description	Format
12:8	Prequel Rail GCB ID	Value 0-31. Set to the Rail GCB ID of the rail that should precede this device's rail in a sequence order.	Integer Unsigned
4:0	Sequel Rail GCB ID	Value 0-31. Set to the Rail GCB ID of the rail that should follow this device's rail in a sequence order.	Integer Unsigned

Bit	Function	Description	Value	Description
15	Prequel Enable	Prequel Enable/Disable.	0	Disable, no prequel preceding this rail.
			1	Enable, prequel to this rail is defined by bits 12:8.
7	Sequel Enable	Sequel Enable/Disable.	0	Disable, no sequel following this rail.
			1	Enable, sequel to this rail is defined by bits 4:0.

**TRACK\_CONFIG (0xE1)**

Transfer Type: R/W Byte

Description: Configures the voltage tracking modes of the device

Bit	Function	Description	Value	Function	Description
7	Enable Voltage Tracking	Enables voltage tracking.	0		Tracking is disabled.
			1		Tracking is enabled.
2	Upper Tracking Ratio	Controls upper tracking ratio.	0	Output Tracks 100% Of VTRK	Output tracks 100% of VTRK.
			1	Output Tracks 50% Of VTRK	Output tracks 50% of VTRK.
1	Upper Track Limit	Controls upper track limit.	0	Limited By Target Voltage	Output is limited by target voltage.
			1	Limited By VTRK	Output is limited by VTRK pin.

**GCB\_GROUP (0xE2)**

Transfer Type: R/W Block (4 bytes)

Description: Rails (output voltages) are assigned group numbers in order to share specific behaviours. The GCB\_GROUP configures fault spreading group ID and enable, broadcast OPERATION group ID and enable, and broadcast VOUT\_COMMAND group ID and enable. Note that GCB Groups are separate and unique from GCB Phases. Current sharing rails need to be in the same DDC Group in order to respond to broadcast VOUT\_COMMAND and OPERATION commands. Power fail event responses are automatically spread in current sharing rails when they are configured using GCB\_CONFIG, regardless of their setting in GCB\_GROUP.

Bit	Function	Description	Format
31:24	Dummy	Not used.	Integer Unsigned
20:16	Broadcast VOUT_COMMAND Group ID	Group ID (0-31) sent as data for broadcast VOUT_COMMAND command events.	Integer Unsigned
12:8	Broadcast OPERATION Group ID	Group ID (0-31) sent as data for broadcast OPERATION command events.	Integer Unsigned
4:0	Power Fail Group ID	Group ID (0-31) sent as data for broadcast power fail events.	Integer Unsigned

Bit	Function	Description	Value	Function	Description
21	Broadcast VOUT_COMMAND AND	Controls how the device should respond to a received broadcast VOUT_COMMAND command	0	Ignore events	Ignores broadcast VOUT_COMMAND command events.

**BMR465 Series PoL Regulators**  
 Input 7.5 - 14 V, Output up to 90 A / 162 W

28701 - BMR 465 Rev. D March 2016

© Ericsson AB

Bit	Function	Description	Value	Function	Description
	Response	event.	1	Respond to events	Respond to broadcast VOUT_COMMAND command events with same Broadcast VOUT_COMMAND Group ID.
13	Broadcast OPERATION Response	Controls how the device should respond to a received broadcast OPERATION command event.	0	Ignore events	Ignores broadcast OPERATION command events.
			1	Respond to events	Respond to broadcast OPERATION command events with same Broadcast Enable Group ID.
5	Power Fail Response	Controls how the device should respond to a received broadcast power fail event.	0	Sequenced Shutdown	Responds to power fail events with same Power Fail Group ID with sequenced shutdown.
			1	Immediate Shutdown	Responds to power fail events with same Power Fail Group ID by shutting down immediately.

**READ\_IOUT1 (0xE3)**

Transfer Type: Read Word

Description: Returns the measured output current of phase 1.

Bit	Description	Format	Unit
15:0	Returns the output current reading of phase 1.	Linear	A

**DEVICE\_ID (0xE4)**

Transfer Type: Read Block (16 bytes)

Description: Returns the 16-byte (character) device identifier string.

Bit	Description	Format
15:0	Returns the 16-byte (character) device identifier string.	ASCII

**MFR\_IOUT\_OC\_FAULT\_RESPONSE (0xE5)**

Transfer Type: R/W Byte

Description: Configures the output overcurrent fault response. The command format is the same as the PMBus standard responses for voltage and temperature faults except that it sets the overcurrent status bit.

Bit	Function	Description	Value	Function	Description
7:6	Response	Describes the device interruption operation. For all modes set by bits [7:6], the device pulls SALERT low and sets the related fault bit in the status registers.	10	Disable and Retry	Disable the output without delay and retry according to the setting in bits [5:3].
5:3	Retry Setting	The device attempts to restart the number of times set by these bits.	000	Do Not Retry	A zero value for the Retry Setting means that the unit does not attempt to restart. The output remains disabled until the fault is cleared.
			111	Retry Continuously	The PMBus device attempts to restart continuously, without limitation, until output is DISABLED, bias power is removed, or another fault condition causes the output to shut down.
2:0	Retry Time	Retry delay time = (Value +1) * 35 ms. Sets the time between retries in 35 ms increments. Range is 35 ms to 280 ms.	000	35 ms	
			001	70 ms	
			010	105 ms	
			011	140 ms	
			100	175 ms	
			101	210 ms	

**BMR465 Series PoL Regulators**  
 Input 7.5 - 14 V, Output up to 90 A / 162 W

28701 - BMR 465 Rev. D March 2016

© Ericsson AB

Bit	Function	Description	Value	Function	Description
			110	245 ms	
			111	280 ms	

**MFR\_IOUT\_UC\_FAULT\_RESPONSE (0xE6)**

Transfer Type: R/W Byte

Description: Configures the output undercurrent fault response. The command format is the same as the PMBus standard responses for voltage and temperature faults except that it sets the undercurrent status bit.

Bit	Function	Description	Value	Function	Description
7:6	Response	Describes the device interruption operation. For all modes set by bits [7:6], the device pulls SALERT low and sets the related fault bit in the status registers.	10	Disable and Retry	Disable the output without delay and retry according to the setting in bits [5:3].
5:3	Retry Setting	The device attempts to restart the number of times set by these bits.	000	Do Not Retry	A zero value for the Retry Setting means that the unit does not attempt to restart. The output remains disabled until the fault is cleared.
			111	Retry Continuously	The PMBus device attempts to restart continuously, without limitation, until output is DISABLED, bias power is removed, or another fault condition causes the output to shut down.
2:0	Retry Time	Retry delay time = (Value +1) * 35 ms. Sets the time between retries in 35 ms increments. Range is 35 ms to 280 ms.	000	35 ms	
			001	70 ms	
			010	105 ms	
			011	140 ms	
			100	175 ms	
			101	210 ms	
			110	245 ms	
			111	280 ms	

**IOUT\_AVG\_OC\_FAULT\_LIMIT (0xE7)**

Transfer Type: R/W Word

Description: Sets the IOUT average overcurrent fault threshold for each phase. For down-slope sensing, this corresponds to the average of all the current samples taken during the (1-D) time interval, excluding the Current Sense Blanking time (which occurs at the beginning of the 1-D interval). For up-slope sensing, this corresponds to the average of all the current samples taken during the D time interval, excluding the Current Sense Blanking time (which occurs at the beginning of the D interval). This feature shares the OC fault bit operation (in STATUS\_IOUT) and OC fault response with IOUT\_OC\_FAULT\_LIMIT.

Bit	Description	Format	Unit
15:0	Sets the IOUT average overcurrent fault threshold for each phase. Thus, the effective fault threshold will be twice the value of this command.	Linear	A

**IOUT\_AVG\_UC\_FAULT\_LIMIT (0xE8)**

Transfer Type: R/W Word

Description: Sets the IOUT average undercurrent fault threshold for each phase. For down-slope sensing, this corresponds to the average of all the current samples taken during the (1-D) time interval, excluding the Current Sense Blanking time (which occurs at the beginning of the 1-D interval). For up-slope sensing, this corresponds to the average of all the current samples taken during the D time interval, excluding the Current Sense Blanking time (which occurs at the beginning of the D interval). This feature shares the UC fault bit operation (in STATUS\_IOUT) and UC fault response with IOUT\_UC\_FAULT\_LIMIT.

Bit	Description	Format	Unit
15:0	Sets the IOUT average undercurrent fault threshold for each phase. Thus, the effective fault threshold will be twice the value of this command.	Linear	A

**BMR465 Series PoL Regulators**  
 Input 7.5 - 14 V, Output up to 90 A / 162 W

28701 - BMR 465 Rev. D March 2016

© Ericsson AB

**MFR\_USER\_CONFIG (0xE9)**

Transfer Type: R/W Word

Description: This command is used to set options for output voltage sensing, maximum output voltage override, SMBus timeout, and GCB and SYNC output configurations.

Bit	Function	Description	Value	Function	Description
15	Dummy	Not used	0	Dummy	
			1	Dummy	
6	GCB Output Control	Configures how the GCB pin is used.	0	Open drain	GCB output is open-drain.
			1	Push-pull	GCB output is push-pull.
4	SMBus Timeout Enable	Enables or disables SMBus time-outs.	0		SMBus time-outs enabled.
			1		SMBus time-outs disabled.
2:1	Sync IO Control	Configures how the SYNC pin is used	00	SYNC pin not used	The internal clock is used for regulator's switching.
			01	SYNC pin as output	The internal clock is output on the SYNC pin, while also being used for regulator's switching.
			10	SYNC pin as input	An external clock on the SYNC pin is used for regulator's switching.

**SNAPSHOT (0xEA)**

Transfer Type: Read Block (32 bytes)

Description: The SNAPSHOT command is a 32-byte read-back of parametric and status values. It allows monitoring and status data to be stored to NVM either during a fault condition or via SNAPSHOT\_CONTROL command. Snapshot is continuously updated in RAM (also when the output is disabled) and can be read using the SNAPSHOT command. When a fault occurs, and that fault is not masked off by the SNAPSHOT\_MASK command, the update of snapshot in RAM is stopped and the latest snapshot in RAM is stored to NVM. That snapshot data can then be read back by reading SNAPSHOT command, also after input voltage has been cycled. By checking the Flash Memory Status bits [183:176] in SNAPSHOT one can tell whether snapshot data is from NVM (due to a fault) or not. [183:176] = 0 means data is from NVM (and the continuous update in RAM is stopped), while [183:176] = 255 means the continuous update of snapshot in RAM is ongoing.

Bit	Function	Description	Format
28:27	Load Current of phase 1	Load current of phase 1.	Linear
26:25	Load Current of phase 0	Load current of phase 0.	Linear
24:23	External Temperature2	External temperature2.	Linear
22	NVM status	Value 0 : Snapshot data is from NVM and the continuous update in RAM is stopped (snapshot disabled) Value 255 : Continuous update of snapshot in RAM is ongoing (snapshot enabled)	Integer Unsigned
21	Manufacturer Specific Status Byte	Manufacturer specific status byte.	Integer Unsigned
20	Status CML	Status CML.	Integer Unsigned
19	Status Temperature	Status temperature.	Integer Unsigned
18	Status Vin	Status Vin.	Integer Unsigned
17	Status Iout	Status Iout.	Integer Unsigned
16	Status Vout	Status vout.	Integer Unsigned
15:14	Switching Frequency	Switching frequency.	Linear
13:12	External Temperature1	External Temperature1	Linear
11:10	Internal Temperature	Internal temperature.	Linear
9:8	Duty Cycle	Duty cycle.	Linear
7:6	Peak Current	Peak current.	Linear
5:4	Load Current	Load current.	Linear

<b>BMR465 Series PoL Regulators</b> Input 7.5 - 14 V, Output up to 90 A / 162 W	28701 - BMR 465 Rev. D	March 2016
	© Ericsson AB	

Bit	Function	Description	Format
3:2	Output Voltage	Output voltage.	Vout Mode Unsigned
1:0	Input Voltage	Input voltage.	Linear

#### BLANK\_PARAMS (0xEB)

Transfer Type: Read Block (16 bytes)

Description: Returns a 16-byte string which indicates which parameter values were either retrieved by the last RESTORE operation or have been written since that time. Reading BLANK\_PARAMS immediately after a restore operation allows the user to determine which parameters are stored in that store. A one indicates the parameter is not present in the store and has not been written since the RESTORE operation.

Bit	Description	Format
15:0		Byte Array

#### LEGACY\_FAULT\_GROUP (0xF0)

Transfer Type: R/W Block (4 bytes)

Description: This command allows the product to fault spread with other BMR products with different definition of the GCB\_GROUP command. The command sets which rail GCB IDs should be listened to for fault spreading information. The data sent is a 4-byte, 32-bit, bit vector where every bit represents a rail's GCB ID. A bit set to 1 indicates a device GCB ID to which the configured device will respond upon receiving a fault spreading event. In this vector, bit 0 of byte 0 corresponds to the rail with GCB ID 0. Following through, Bit 7 of byte 3 corresponds to the rail with GCB ID 31. NOTE: The rail's own GCB ID should not be set within the LEGACY\_FAULT\_GROUP command for that device/rail. All products in a current share rail must shutdown for the rail to report a shutdown. If fault spread mode is enabled in USER\_CONFIG, the device will immediately shut down if one of its GCB\_GROUP members fail. The rail will attempt its configured restart only after all devices/rails within the GCB\_GROUP have cleared their faults. If fault spread mode is disabled in USER\_CONFIG, the device will perform a sequenced shutdown as defined by the SEQUENCE command setting. The rails/devices in a sequencing set only attempt their configured restart after all faults have cleared within the GCB\_GROUP. If fault spread mode is disabled and sequencing is also disabled, the device will ignore faults from other devices and stay enabled.

Bit	Description	Format
31:0		Byte Array

#### READ\_IOUT0 (0xF2)

Transfer Type: Read Word

Description: Returns the measured output current of phase 0.

Bit	Description	Format	Unit
15:0	Returns the output current reading of phase 0.	Linear	A

#### SNAPSHOT\_CONTROL (0xF3)

Transfer Type: R/W Byte

Description: Used to erase snapshot data in NVM or copy snapshot data between RAM and NVM. Note: It is advised that these operations be performed while the output voltage is disabled.

Bit	Description	Value	Function	Description
0	Used to perform memory operations of snapshot data. Note: It is advised that this operation be performed while the output voltage is disabled.	0x01	Copy NVM to RAM	Causes the current SNAPSHOT values in NVM to be copied to RAM.
		0x02	Store RAM to NVM.	Causes the values to be stored in set location in NVM memory.
		0x03	Erase in NVM	Erase the snapshot data from NVM.

#### MFR\_VMON\_OV\_FAULT\_LIMIT (0xF5)

Transfer Type: R/W Word

Description: Sets the VMON overvoltage fault threshold. The VMON input is used to measure the highest temperature of the power stages. The VMON overvoltage warn limit is automatically set to 95% of this fault value.

Bit	Description	Format	Unit
-----	-------------	--------	------

**BMR465 Series PoL Regulators**  
**Input 7.5 - 14 V, Output up to 90 A / 162 W**

Bit	Description	Format	Unit
15:0	Sets the VMON overvoltage fault threshold.	Linear	V

**MFR\_VMON\_UV\_FAULT\_LIMIT (0xF6)**

Transfer Type: R/W Word

Description: Sets the VMON undervoltage fault threshold. The VMON input is used to measure the highest temperature of the power stages. The VMON undervoltage warn limit is automatically set to 110% of this fault value.

Bit	Description	Format	Unit
15:0	Sets the VMON undervoltage fault threshold.	Linear	V

**MFR\_READ\_VMON (0xF7)**

Transfer Type: Read Word

Description: Returns the VMON voltage reading, which is proportional to the highest temperature in the power stages according to  $T = 92.5 * VMON - 255$ .

Bit	Description	Format	Unit
15:0	Returns the VMON voltage reading.	Linear	V

**VMON\_OV\_FAULT\_RESPONSE (0xF8)**

Transfer Type: R/W Byte

Description: Sets the VMON overvoltage fault response.

Bit	Function	Description	Value	Function	Description
7:6	Response	Describes the device interruption operation. For all modes set by bits [7:6], the device pulls SALERT low and sets the related fault bit in the status registers.	10	Disable and Retry	Disable the output without delay and retry according to the setting in bits [5:3].
5:3	Retry Setting	The device attempts to restart the number of times set by these bits.	000	Do Not Retry	A zero value for the Retry Setting means that the unit does not attempt to restart. The output remains disabled until the fault is cleared.
			111	Retry Continuously	The PMBus device attempts to restart continuously, without limitation, until output is DISABLED, bias power is removed, or another fault condition causes the output to shut down.
2:0	Retry Time	Retry delay time = (Value +1) * 35 ms. Sets the time between retries in 35 ms increments. Range is 35 ms to 280 ms.	000	35 ms	
			001	70 ms	
			010	105 ms	
			011	140 ms	
			100	175 ms	
			101	210 ms	
			110	245 ms	
			111	280 ms	

**VMON\_UV\_FAULT\_RESPONSE (0xF9)**

Transfer Type: R/W Byte

Description: Sets the VMON undervoltage fault response.

Bit	Function	Description	Value	Function	Description
7:6	Response	Describes the device interruption operation. For all modes set by bits [7:6], the device pulls SALERT low and sets the related fault bit in the status registers.	10	Disable and Retry	Disable the output without delay and retry according to the setting in bits [5:3].

111	280 ms				

**SECURITY\_LEVEL (0xFA)**

Transfer Type: Read Byte

Description: Returns the current security level. The device provides write protection for individual commands. Each bit in the UNPROTECT parameter controls whether its corresponding command is writable (commands are always readable). If a command is not writable, a password must be entered in order to change its parameter (i.e., to enable writes to that command). There are two types of passwords, public and private. The public password provides a simple lock-and-key protection against accidental changes to the device. It would typically be sent to the device in the application prior to making changes. Private passwords allow commands marked as non-writable in the UNPROTECT parameter to be changed. Private passwords are intended for protecting Default-installed configurations and would not typically be used in the application. Each store (USER and DEFAULT) can have its own UNPROTECT string and private password. If a command is marked as non-writable in the DEFAULT UNPROTECT parameter (its corresponding bit is cleared), the private password in the DEFAULT Store must be sent in order to change that command. If a command is writable according to the Default UNPROTECT parameter, it may still be marked as non-writable in the User Store UNPROTECT parameter. In this case, the User private password can be sent to make the command writable.

Bit	Description	Value	Function	Description
7:0	The device provides write protection for individual commands.	0x03	Level 3	Security Level 3 – Module Vendor.
		0x02	Level 2	Security Level 2 – User.
		0x01	Level 1	Security Level 1 – Public.
		0x00	Level 0	Security Level 0 - Unprotected.

**PRIVATE\_PASSWORD (0xFB)**

Transfer Type: R/W Block (9 bytes)

Description: Sets the private password string for the USER\_STORE. Password strings have the same format as the MFR\_ID parameters.

Bit	Description	Format
8:0	Sets the private password string for the USER_STORE.	ASCII

**PUBLIC\_PASSWORD (0xFC)**

Transfer Type: R/W Block (4 bytes)

Description: Sends a password to the device.

Bit	Description	Format
3:0	Sets the public password string.	ASCII

	© Ericsson AB	

**UNPROTECT (0xFD)**

Transfer Type: R/W Block (32 bytes)

Description: Sets a 256-bit (32-byte) parameter which identifies which commands are to be protected against write-access at lower security levels. Each bit in this parameter corresponds to a command according to the command's code. The command with a code of 00h (PAGE) is protected by the least-significant bit of the least-significant byte, followed by the command with a code of 01h and so forth. Note that all possible commands have a corresponding bit regardless of whether they are protectable or supported by the device. Clearing a command's UNPROTECT bit indicates that write-access to that command is only allowed if the device's security level has been raised to an appropriate level. The UNPROTECT bits in the DEFAULT store require a security level 3 or greater to be writeable. The UNPROTECT bits in the USER store require a security level of 2 or higher.

Bit	Description	Format
31:0		Byte Array
