

PKJ4716HD Series DC/DC Converters
 Input 36-75 V, Output 14 A / 700 W

1/28701-BMR686 Rev.A

Mar 2023

© Flex

Key Features

- Industry standard Half-brick
61.0 x 57.9 x 12.7 mm (2.4 x 2.28 x 0.50 in)
- High efficiency, typ. 95.8% at 48V_{in} full load
- 1500 Vdc input to output isolation
- Meets safety requirements according to IEC/EN/UL 62368-1
- MTBF 6.41 Million hours

General Characteristics

- Output over voltage protection
- Input under voltage shutdown
- Over temperature protection
- Monotonic start-up
- Output short-circuit protection
- Remote sense
- Remote control
- Highly automated manufacturing ensures quality
- ISO 9001/14001 certified supplier

Safety Approvals

Design for Environment

Meets requirements in high-temperature lead-free soldering processes.

Options	Description
n ₁	PI Through hole
n ₂	Negative Logic * P Positive Logic
n ₃	HS Baseplate
n ₄	5.33mm * LA 3.69mm

Example a through-hole mounted, positive logic with baseplate, 3.69mm lead length would be PKJ4716HDPIPHSLA.

* Standard variant (i.e. no option selected).

General Information

Reliability

The failure rate (λ) and mean time between failures (MTBF = $1/\lambda$) is calculated at max output power and an operating ambient temperature (T_A) of +40°C. Flex Power Modules uses Telcordia SR-332 Issue 4 Method 1 to calculate the mean steady-state failure rate and standard deviation (σ).

Telcordia SR-332 Issue 4 also provides techniques to estimate the upper confidence levels of failure rates based on the mean and standard deviation.

Mean steady-state failure rate,	Std. deviation, σ
156 nFailures/h	22.6 nFailures/h

MTBF (mean value) for the PKJ4716HD = 6.41 Mh.

MTBF at 90% confidence level = 5.4 Mh

Compatibility with RoHS requirements

The products are compatible with the relevant clauses and requirements of the RoHS directive 2011/65/EU and have a maximum concentration value of 0.1% by weight in homogeneous materials for lead, mercury, hexavalent chromium, PBB and PBDE and of 0.01% by weight in homogeneous materials for cadmium.

Exemptions in the RoHS directive utilized in Flex Power

Modules products are found in the Statement of Compliance document.

Flex Power Modules fulfills and will continuously fulfill all its obligations under regulation (EC) No 1907/2006 concerning the registration, evaluation, authorization and restriction of chemicals (REACH) as they enter into force and is through product materials declarations preparing for the obligations to communicate information on substances in the products.

Quality Statement

The products are designed and manufactured in an industrial environment where quality systems and methods like ISO 9000, Six Sigma, and SPC are intensively in use to boost the continuous improvements strategy. Infant mortality or early failures in the products are screened out and they are subjected to an ATE-based final test. Conservative design rules, design reviews and product qualifications, plus the high competence of an engaged work force, contribute to the high quality of the products.

Warranty

Warranty period and conditions are defined in Flex Power Modules General Terms and Conditions of Sale.

Limitation of Liability

Flex Power Modules does not make any other warranties, expressed or implied including any warranty of merchantability or fitness for a particular purpose (including, but not limited to, use in life support applications, where malfunctions of product can cause injury to a person's health or life).

© Flex 2023

The information and specifications in this technical specification is believed to be correct at the time of publication. However, no liability is accepted for inaccuracies, printing errors or for any consequences thereof. Flex reserves the right to change the contents of this technical specification at any time without prior notice.

Safety Specification

General information

Flex Power DC/DC converters and DC/DC regulators are designed in accordance with the safety standards IEC 62368-1, EN 62368-1 and UL 62368-1 *Audio/video, information and communication technology equipment - Part 1: Safety requirements*

IEC/EN/UL 62368-1 contains requirements to prevent injury or damage due to the following hazards:

- Electrical shock
- Electrically-caused fire
- Injury caused by hazardous substances
- Mechanically-caused injury
- Skin burn
- Radiation-caused injury

On-board DC/DC converters, Power interface modules and DC/DC regulators are defined as component power supplies. As components they cannot fully comply with the provisions of any safety requirements without "conditions of acceptability". Clearance between conductors and between conductive parts of the component power supply and conductors on the board in the final product must meet the applicable safety requirements. Certain conditions of acceptability apply for component power supplies with limited stand-off (see Mechanical Information for further information). It is the responsibility of the installer to ensure that the final product housing these components complies with the requirements of all applicable safety standards and regulations for the final product.

Component power supplies for general use shall comply with the requirements in IEC/EN/UL 62368-1. Product related standards, e.g. IEEE 802.3af *Power over Ethernet*, and ETS-300132-2 *Power interface at the input to telecom equipment, operated by direct current (dc)* are based on IEC/EN/UL 62368-1 with regards to safety.

Flex Power DC/DC converters, Power interface modules and DC/DC regulators are UL 62368-1 recognized and certified in accordance with EN 62368-1. The flammability rating for all construction parts of the products meet requirements for V-0 class material according to IEC 60695-11-10, *Fire hazard testing, test flames – 50 W* horizontal and vertical flame test methods.

Isolated DC/DC converters & Power interface modules

The product may provide basic or functional insulation between input and output according to IEC/EN/UL 62368-1 (see Safety Certificate), different conditions shall be met if the output of a basic or a functional insulated product shall be considered as ES1 energy source.

For basic insulated products (see Safety Certificate) the output is considered as ES1 energy source if one of the following conditions is met:

- The input source provides supplementary or double or reinforced insulation from the AC mains according to IEC/EN/UL 62368-1.
- The input source provides functional or basic insulation from the AC mains and the product's output is reliably connected to protective earth according to IEC/EN/UL 62368-1.

For functional insulated products (see Safety Certificate) the output is considered as ES1 energy source if one of the following conditions is met:

- The input source provides double or reinforced insulation from the AC mains according to IEC/EN/UL 62368-1.
- The input source provides basic or supplementary insulation from the AC mains and the product's output is reliably connected to protective earth according to IEC/EN/UL 62368-1.
- The input source is reliably connected to protective earth and provides basic or supplementary insulation according to IEC/EN/UL 62368-1 and the maximum input source voltage is 60 Vdc.

Galvanic isolation between input and output is verified in an electric strength test and the isolation voltage (V_{iso}) meets the voltage strength requirement for basic insulation according to IEC/EN/UL 62368-1.

It is recommended to use a slow blow fuse at the input of each DC/DC converter. If an input filter is used in the circuit the fuse should be placed in front of the input filter. In the rare event of a component problem that imposes a short circuit on the input source, this fuse will provide the following functions:

- Isolate the fault from the input power source so as not to affect the operation of other parts of the system
- Protect the distribution wiring from excessive current and power loss thus preventing hazardous overheating

Absolute Maximum Ratings

Characteristics		min	typ	max	Unit
T _A	Ambient Operating Temperature	-40		+85	°C
T _{P1}	Operating Temperature (see Thermal Consideration section)	-40		+125	°C
T _{P2}	Base plate Operating Temperature	-40		+100	°C
T _S	Storage temperature	-55		+125	°C
V _I	Input voltage	-0.5		+80	V
C _{in}	Input capacitance	470			µF
C _{out}	Output capacitance	1000		3400	µF
V _{iso}	Isolation voltage (input to output)			1500	Vdc
V _{iso}	Isolation voltage (input to baseplate)			750	Vdc
V _{iso}	Isolation voltage (baseplate to output)			750	Vdc
V _{tr}	Input voltage transient according to ETSI EN 300 132-2 and Telecordia GR-1089-CORE			100	V
V _{adj}	Adjust pin voltage (see Operating Information section)	-0.5		5	V
V _{RC}	Remote Control pin voltage (see Operating Information section)	Positive logic option		6	V
		Negative logic option	-0.5	6	V

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the Electrical Specification section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Exposure to conditions outside normal operating can conditions may violate design rules and therefore also reliability.

Typical Characteristics
 50 V, 14 A / 700 W

PKJ4716HD

Start-up

Start-up enabled by connecting V_1 at:
 $T_{P1} = +25^\circ\text{C}$, $V_1 = 48\text{ V}$,
 $I_o = 14\text{ A}$ resistive load.

Top trace: input voltage (50 V/div.).
 Bottom trace: output voltage (10 V/div.).
 Time scale: (50 ms/div.).

Shut-down

Shut-down enabled by disconnecting V_1 at:
 $T_{P1} = +25^\circ\text{C}$, $V_1 = 48\text{ V}$,
 $I_o = 14\text{ A}$ resistive load.

Top trace: input voltage (50 V/div.).
 Bottom trace: output voltage (10 V/div.).
 Time scale: (10 ms/div.).

Output Ripple & Noise

Output voltage ripple at:
 $T_{P1} = +25^\circ\text{C}$, $V_1 = 48\text{ V}$,
 $I_o = 14\text{ A}$ resistive load.

Trace: output voltage (200 mV/div.).
 Time scale: (10 μs /div.).

Output Load Transient Response

Output voltage response to load current step-change (3.5-10.5-3.5 A) at:
 $T_{P1} = +25^\circ\text{C}$, $V_1 = 48\text{ V}$.

Top trace: output voltage (500 mV/div.).
 Bottom trace: load current (10 A/div.).
 Time scale: (0.5 ms/div.).

Output Voltage Adjust (see operating information)

Passive adjust

The resistor value for an adjusted output voltage is calculated by using the following equations:

Output Voltage Adjust, Decrease:

$$R_{adj} = \left(\frac{100}{\Delta\%} - 2 \right) \text{ k}\Omega$$

Output Voltage Adjust, Increase:

$$R_{adj} = \left(\frac{50 \times (100 + \Delta\%)}{1.225 \times \Delta\%} - \frac{100}{\Delta\%} - 2 \right) \text{ k}\Omega$$

Example: Increase 10% => $V_o = 55\text{ Vdc}$

$$\left(\frac{50 \times (100 + 10)}{1.225 \times 10} - \frac{100}{10} - 2 \right) \text{ k}\Omega = 437 \text{ k}\Omega$$

Active adjust

The output voltage can be adjusted using a voltage applied to the V_{adj} pin. This voltage is calculated by using the following equation:

$$V_{adj} = \left(1.225 + (R_{adj} + 2) \times 1.225 \times \frac{V_{desired} - 50}{50} \right)$$

EMC Specification

Conducted EMI measured according to EN55032, CISPR 32 and FCC part 15J (see test set-up). See Design Note 009 for further information. The fundamental switching frequency is 160 kHz for PKJ4716HD at $V_i = 48\text{ V}$ and max I_o .

Conducted EMI Input terminal value (typ)

EMI without filter (pre-scan, peak detector results)

Optional external filter for class B

Suggested external input filter in order to meet class B in EN 55022, CISPR 22 and FCC part 15J. The increased input capacitance ensures stable operation at min V_{in} with recommended CM- chokes.

EMI with filter (pre-scan, peak detector results)

Test set-up

Layout recommendations

The radiated EMI performance of the product will depend on the PWB layout and ground layer design. It is also important to consider the stand-off of the product. If a ground layer is used, it should be connected to the output of the product and the equipment ground or chassis.

A ground layer will increase the stray capacitance in the PWB and improve the high frequency EMC performance.

The product includes positions for capacitors that internally connect the base plate to the power pins, please contact your local Flex sales contact for further info as this is not included in the standard variant.

Output ripple and noise

Output ripple and noise measured according to figure below. See Design Note 022 for detailed information.

Operating information

Input Voltage

The input voltage range 36 to 75 Vdc meets the requirements of the European Telecom Standard ETS 300 132-2 for normal input voltage range in -48 and -60 Vdc systems, -40.5 to -57.0 V and -50.0 to -72 V respectively.

At input voltages exceeding 75 V, the power loss will be higher than at normal input voltage and T_{P1} must be limited to absolute max +125 °C. The absolute maximum continuous input voltage is 80 Vdc.

Short duration transient disturbances can occur on the DC distribution and input of the product when a short circuit fault occurs on the equipment side of a protective device (fuse or circuit breaker). The voltage level, duration and energy of the disturbance are dependent on the particular DC distribution network characteristics and can be sufficient to damage the product unless measures are taken to suppress or absorb this energy. The transient voltage can be limited by capacitors and other energy absorbing devices like TVS diode connected across the positive and negative input conductors at a number of strategic points in the distribution network. The end-user must secure that the transient voltage will not exceed the value stated in the Absolute maximum ratings. ETSI TR 100 283 examines the parameters of DC distribution networks and provides guidelines for controlling the transient and reduce its harmful effect.

Turn-off Input Voltage

The products monitor the input voltage and will turn on and turn off at predetermined levels.

The minimum hysteresis between turn on and turn off input voltage is 1 V.

Remote Control (RC)

The products are fitted with a remote control function referenced to the primary negative input connection (-In), with negative and positive logic options available. The RC function allows the product to be turned on/off by an external device like a semiconductor or mechanical switch. The RC pin has an internal pull up resistor to +10V.

The external device must provide a minimum required sink current to guarantee a voltage not higher than maximum voltage on the RC pin (see Electrical characteristics table). When the RC pin is left open, the voltage generated on the RC pin is 3.3 V.

The standard product is provided with “negative logic” RC and will be off until the RC pin is connected to the -In. To turn off the product the RC pin should be left open, or connected to a voltage higher than 3.3 V referenced to -In. In situations where

it is desired to have the product to power up automatically without the need for control signals or a switch, the RC pin can be wired directly to -In.

The second option is “positive logic” remote control, which can be ordered by adding the suffix “P” to the end of the part number. When the RC pin is left open, the product starts up automatically when the input voltage is applied. Turn off is achieved by connecting the RC pin to the -In. The product will restart automatically when this connection is opened.

See Design Note 021 for detailed information.

Input and Output Impedance

The impedance of both the input source and the load will interact with the impedance of the product. It is important that the input source has low characteristic impedance. The performance in some applications can be enhanced by addition of external capacitance as described under External Decoupling Capacitors.

If the input voltage source contains significant inductance, the value of the external input capacitor must be increased to ensure stable operation at low input voltage. The added capacitance is not required when powering the product from an input source with an inductance below 10 μ H. The minimum required capacitance value depends on the output power and the input voltage. The higher output power the higher input capacitance is needed.

External Decoupling Capacitors

When powering loads with significant dynamic current requirements, the voltage regulation at the point of load can be improved by addition of decoupling capacitors at the load. The most effective technique is to locate low ESR ceramic and electrolytic capacitors as close to the load as possible, using several parallel capacitors to lower the effective ESR. The ceramic capacitors will handle high-frequency dynamic load changes while the electrolytic capacitors are used to handle low frequency dynamic load changes. It is equally important to use low resistance and low inductance PWB layouts and cabling.

External decoupling capacitors will become part of the product’s control loop. The control loop is optimized for a wide range of external capacitance and the maximum recommended value that could be used without any additional analysis is found in the Electrical specification.

The ESR of the capacitors is a very important parameter. Stable operation is guaranteed with a verified ESR value of >10 m Ω across the output connections.

For further information please contact your local Flex Power Modules representative.

Output Voltage Adjust (V_{adj})

The products have an Output Voltage Adjust pin (V_{adj}). This pin can be used to adjust the output voltage above or below Output voltage initial setting.

PKJ4716HD Series DC/DC Converters

Input 36-75 V, Output 14 A / 700 W

1/28701-BMR686 Rev.A

Mar 2023

© Flex

When increasing the output voltage, the voltage at the output pins (including any remote sense compensation) must be kept below the threshold of the over voltage protection, (OVP) to prevent the product from shutting down. At increased output voltages the maximum power rating of the product remains the same, and the max output current must be decreased correspondingly.

Output Voltage Adjust (V_{adj})

To increase the voltage the resistor should be connected between the V_{adj} pin and +Sense pin. The resistor value of the Output voltage adjust function is according to information given under the Output section for the respective product. To decrease the output voltage, the resistor should be connected between the V_{adj} pin and -Sense pin.

Over Voltage Protection (OVP)

The products have output over voltage protection that will shut down the product in over voltage conditions. The product will make continuous attempts to start up (non-latching mode) and resume normal operation automatically after removal of the over voltage condition.

Over Current Protection (OCP)

The products include current limiting circuitry for protection at continuous overload. The output voltage will decrease towards zero for output currents in excess of max output current (max I_o). The product will resume normal operation after removal of the overload. The load distribution should be designed for the maximum output short circuit current specified.

Pre-bias Start-up

The product has a Pre-bias start up functionality and will not sink current during start up if a pre-bias source is present at the output terminals. The module will enable pre-biased start-up when V_{out} is 4% less than target, e.g., if V_{out} is set to 50 V, restart is possible once V_{out} descend below 48V. This is internally controlled by the module.

Parallel Operation

Two products may be paralleled for redundancy if the total power is equal or less than P_O max. It is not recommended to parallel the products without using external current sharing circuits.

See Design Note 006 for detailed information.

Remote Sense

The products have remote sense that can be used to compensate for voltage drops between the output and the point of load. The sense traces should be located close to the PWB ground layer to reduce noise susceptibility. The remote sense circuitry will compensate for up to 2% voltage drop between output pins and the point of load.

If the remote sense is not needed +Sense should be connected to +Out and -Sense should be connected to -Out.

Over Temperature Protection (OTP)

The products are protected from thermal overload by an internal over temperature shutdown circuit. The product will make continuous attempts to start up (non-latching mode) and resume normal operation automatically when the temperature drops below the temperature threshold.

Thermal Consideration

General

The products are designed to operate in different thermal environments and sufficient cooling must be provided to ensure reliable operation.

For products mounted on a PWB without a heat sink attached, cooling is achieved mainly by conduction, from the pins to the host board, and convection, which is dependent on the airflow across the product. Increased airflow enhances the cooling of the product.

The product is tested on a 254 x 254 mm, 35 μm (1 oz), 16-layer test board.

For products with base plate used in a sealed box/cold wall application, cooling is achieved mainly by conduction through the cold wall. The Output Current Derating graphs are found in the Output section for each model. The product is tested in a sealed box test set up with ambient temperatures 85 °C. See Design Note 028 for further details.

Definition of product operating temperature

The product operating temperatures is used to monitor the temperature of the product, and proper thermal conditions can be verified by measuring the temperature at positions P1 and P2. The temperature at these positions (T_{P1} , T_{P2}) should not exceed the maximum temperatures in the table below. The number of measurement points may vary with different thermal design and topology. Temperatures above maximum T_{P1} , measured at the reference point P1 are not allowed and may cause permanent damage.

Position	Description	Max Temp.
P1	NTC	$T_{P1}=125^{\circ}\text{C}$
P2	Base plate	$T_{P2}=100^{\circ}\text{C}$

Reference point on top side

Reference point on baseplate

Ambient Temperature Calculation

For products with base plate the maximum allowed ambient temperature can be calculated by using the thermal resistance.

1. The power loss is calculated by using the formula $((1/\eta) - 1) \times \text{output power} = \text{power losses } (P_d)$.
 η = efficiency of product. E.g. 89.5% = 0.895

2. Find the thermal resistance (R_{th}) in the Thermal Resistance graph found in the Output section for each model. **Note that the thermal resistance can be significantly reduced if a heat sink is mounted on the top of the base plate.**

Calculate the temperature increase (ΔT).

$$\Delta T = R_{th} \times P_d$$

3. Max allowed ambient temperature is:

$$\text{Max } T_{P1} - \Delta T.$$

4. The thermal performance can be significantly improved by mounting a heat sink on top of the base plate.

The thermal resistance between base plate and heat sink, $R_{th, b-h}$ is calculated as:

PKJ4716HD Series DC/DC Converters
 Input 36-75 V, Output 14 A / 700 W

1/28701-BMR686 Rev.A

Mar 2023

© Flex

$$R_{th, b-h} = \frac{T_{base\ plate} - T_{heat\ sink}}{P_{loss}}$$

The actual temperature will be dependent on several factors such as the PWB size, number of layers and direction of airflow.

Connections

Pin	Designation	Function
1	+In	Positive input
2	RC	Remote control
3	NC	Pin w/o electrical properties
4	-In	Negative input
5	-Out	Negative output
6	-Sense	Negative remote sense
7	V _{adj}	Output voltage adjust
8	+Sense	Positive remote sense
9	+Out	Positive output

Mechanical Information - Hole Mount, Base Plate Version

RECOMMENDED FOOTPRINT - TOP VIEW

CASE:
 Material: Aluminium
 For screw attachment apply mounting torque of max 0.44Nm [3.9 lbf in].

Pins:
 Pins Material: Copper alloy
 Plating: Min Au 0.1 µm over 1-3 µm Ni.

Weight: Typical 97.3 g
 All dimensions in mm [inch]
 Tolerances unless specified:
 x.x ±0.5 mm [0.02],
 x.xx±0.25 mm [0.01]
 (not applied on footprint or typical values)

All component placements – whether shown as physical components or symbolical outline – are for reference only and are subject to change throughout the product's life cycle, unless explicitly described and dimensioned in this drawing.

Soldering Information - Hole Mounting

The hole mounted product is intended for plated through hole mounting by wave or manual soldering. The pin temperature is specified to maximum to 270°C for maximum 10 seconds.

A maximum preheat rate of 4°C/s and maximum preheat temperature of 150°C is suggested. When soldering by hand, care should be taken to avoid direct contact between the hot soldering iron tip and the pins for more than a few seconds in order to prevent overheating.

A no-clean flux is recommended to avoid entrapment of cleaning fluids in cavities inside the product or between the product and the host board. The cleaning residues may affect long time reliability and isolation voltage.

Delivery Package Information

The products are delivered in antistatic trays.

Tray Specifications	
Material	Antistatic PE Foam
Surface resistance	$10^5 < \text{Ohm/square} < 10^{11}$
Bakability	The trays are not bakeable
Box capacity	30 products (3 full tray/box)
Tray weight	Product – Baseplate Version 140 g empty, 1110 g full tray
