HM514170A/AL, HM51S4170A/AL Series

262,144-Word x 16-Bit Dynamic Random Access Memory

■ DESCRIPTION

The Hitachi HM514170A/AL are CMOS dynamic RAM organized as 262,144-word x 16-bit. HM514170A/AL have realized higher density, higher performance and various functions by employing 0.8 μm CMOS process technology and some new CMOS circuit design technologies. The HM514170A/AL offer fast page mode as a high speed access mode.

Multiplexed address input permits the HM514170A/AL to be packaged in standard 400 mil 40-pin plastic SOJ, standard 475 mil 40-pin plastic ZIP and standard 400 mil 40-pin plastic TSOPII.

Internal refresh timer enables HM51S4170A/AL self refresh operation.

■ FEATURES

- Single 5V (±10%)
- High Speed
  - Access Time .....70 ns/80 ns/100 ns (max)
- Low Power Dissipation
  - Active Mode .....742.5 mW/660 mW/550 mW (max)
  - Standby Mode .....11 mW (max)
  - 1.1 mW (max) (L-Version)
- Fast Page Mode Capability
- 1,024 Refresh Cycle .....16 ms
  - 128 ms (L-Version)
- 2 $\overline{WE}$ Byte Control
- 2 Variations of Refresh
  - $\overline{RAS}$ Only Refresh
  - $\overline{CAS}$ Before $\overline{RAS}$ Refresh
- Battery Back-up Operation (L-Version)
- Self-Refresh Operation (HM51S4170A/AL)

2

■ ORDERING INFORMATION

■ ABSOLUTE MAXIMUM RATINGS

Parameter	Symbol	Value	Unit
Voltage on Any Pin Relative to V_{SS}	V_T	−1.0 to +7.0	V
Supply Voltage Relative to V_{SS}	V_{CC}	−1.0 to +7.0	V
Short Circuit Output Current	I_{out}	50	mA
Power Dissipation	P_T	1.0	W
Operating Temperature	T_{opr}	0 to +70	°C
Storage Temperature	T_{stg}	−55 to +125	°C

■ ELECTRICAL CHARACTERISTICS

• Recommended DC Operating Conditions (T_A = 0 to +70°C)[2]

Parameter		Symbol	Min	Typ	Max	Unit	Note
Supply Voltage		V_{SS}	0	0	0	V	
		V_{CC}	4.5	5.0	5.5	V	1
Input High Voltage		V_{IH}	2.4	—	6.5	V	1
Input Low Voltage	(I/O Pin)	V_{IL}	−1.0	—	0.8	V	1
	(Others)	V_{IL}	−2.0	—	0.8	V	1

Notes: 1. All voltage referenced to V_{SS}.
2. The supply voltage with all V_{CC} pins must be on the same level.
The supply voltage with all V_{SS} pins must be on the same level.

• DC Electrical Characteristics (T_A = 0 to +70°C, V_{CC} = 5V ±10%, V_{SS} = 0V)

Parameter	Symbol	HM514170A/AL-7 HM51S4170A/AL-7		HM514170A/AL-8 HM51S4170A/AL-8		HM514170A/AL-10 HM51S4170A/AL-10		Unit	Test Conditions	Note
		Min	Max	Min	Max	Min	Max			
Operating Current	I_{CC1}	—	135	—	120	—	100	mA	$\overline{RAS}$, $\overline{CAS}$ cycling t_{RC} = min	1, 2

$\overline{RAS}$ Only Refresh Current	I_{CC3}	—	130	—	115	—	100	mA	t_{RC} = min	2
Standby Current	I_{CC5}	—	5	—	5	—	5	mA	$\overline{RAS}$ = V_{IH} $\overline{CAS}$ = V_{IL} D_{out} = Enable	1
$\overline{CAS}$ Before $\overline{RAS}$ Refresh Current	I_{CC6}	—	130	—	115	—	100	mA	t_{RC} = min	25
Fast Page Mode Current	I_{CC7}	—	130	—	120	—	110	mA	t_{PC} = min	1, 3
Battery Back-up Current (Standby with CBR Refresh) (L-Version)	I_{CC10}	—	300	—	300	—	300	µA	Standby: CMOS Interface D_{out} = High-Z CBR Refresh: $t_{\overline{RC}}$ = 125 µs $t_{\overline{RAS}}$ ≤ 1 µs, $\overline{CAS}$ = V_{IL} $\overline{UWE}$, $\overline{LWE}$, $\overline{OE}$ = V_{IH}	4
Self-Refresh Mode Current (HM51S4170A)	I_{CC11}	—	1	—	1	—	1	mA	CMOS Interface $\overline{RAS}$, $\overline{CAS}$ ≤ 0.2V D_{out} = High-Z	
Self-Refresh Mode Current (HM51S4170AL)		—	200	—	200	—	200	µA	CMOS Interface $\overline{RAS}$, $\overline{CAS}$ ≤ 0.2V D_{out} = High-Z	
Input Leakage Current	I_{LI}	−10	10	−10	10	−10	10	µA	0V ≤ V_{in} ≤ 6.5V	
Output Leakage Current	I_{LO}	−10	10	−10	10	−10	10	µA	0V ≤ V_{out} ≤ 6.5V D_{out} = Disable	
Output High Voltage	V_{OH}	2.4	V_{CC}	2.4	V_{CC}	2.4	V_{CC}	V	High I_{out} = −5.0 mA	
Output Low Voltage	V_{OL}	0	0.4	0	0.4	0	0.4	V	Low I_{out} = 4.2 mA	

Notes: 1. I_{CC} depends on output load condition when the device is selected. I_{CC} max is specified at the output open condition.
2. Address can be changed ≤ 1 time while $\overline{RAS}$ = V_{IL}.
3. Address can be changed ≤ 1 time while $\overline{CAS}$ = V_{IH}.
4. V_{IH} ≥ V_{CC} − 0.2V, V_{IL} ≤ 0.2V; Address can be changed ≤ 1 time while $\overline{RAS}$ = V_{IL}.
5. All the V_{CC} pins shall be supplied with the same voltage.
All the V_{SS} pins shall be supplied with the same voltage.

• **Capacitance** (T_A = 25°C, V_{CC} = 5V ±10%)

Parameter	Symbol	Typ	Max	Unit	Note
Input Capacitance (Address)	C_{I1}	—	5	pF	1
Input Capacitance (Clocks)	C_{I2}	—	7	pF	1
Output Capacitance (Data-in, Data-out)	$C_{I/O}$	—	10	pF	1, 2

Notes: 1. Capacitance measured with Boonton Meter or effective capacitance measuring method.
2. $\overline{CAS}$ = V_{IH} to disable D_{out}.

• **AC Characteristics** (T_A = 0 to +70°C, V_{CC} = 5V ±10%, V_{SS} = 0V)[1, 14, 15, 17, 18]

Test Conditions

- Input rise and fall times: 5 ns
- Input timing reference levels: 0.8V, 2.4V
- Output load: 2 TTL gate + C_L (100 pF) (Including scope and jig)

Self-Refresh Mode

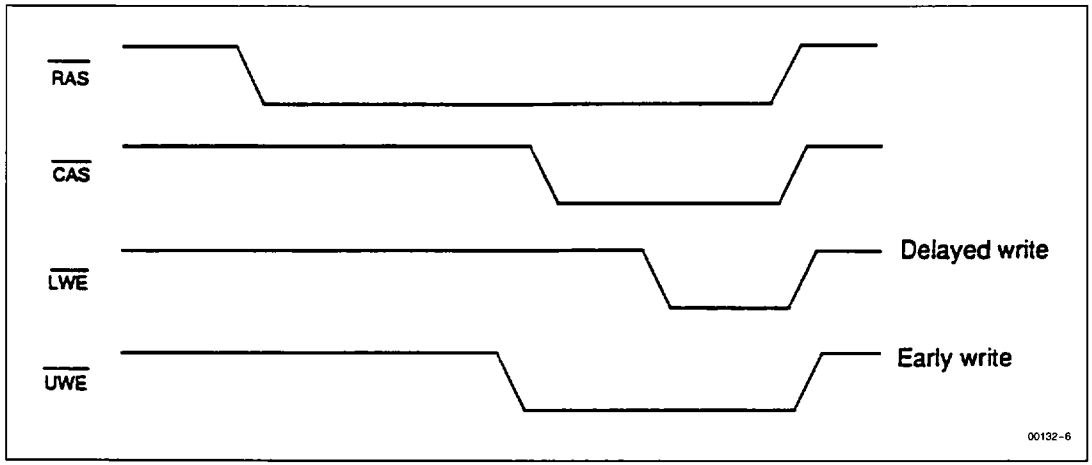
Parameter	Symbol	HM51S4170A/AL-7		HM51S4170A/AL-8		HM51S4170A/AL-10		Unit	Note
		Min	Max	Min	Max	Min	Max		
$\overline{RAS}$ Pulse Width (Self-Refresh)	t_{RASS}	100	—	100	—	100	—	μs	
$\overline{RAS}$ Precharge Time (Self-Refresh)	t_{RPS}	130	—	150	—	180	—	ns	
$\overline{CAS}$ Hold Time (Self-Refresh)	t_{CHS}	− 50	—	− 50	—	− 50	—	ns	

Notes:
1. AC measurements assume $t_T = 5$ ns.
2. Assumes that $t_{RCD} \leq t_{RCD}$ (max) and $t_{RAD} \leq t_{RAD}$ (max). If t_{RCD} or t_{RAD} is greater than the maximum recommended value shown in this table, t_{RAC} exceeds the value shown.
3. Measured with a load circuit equivalent to 2 TTL loads and 100 pF.
4. Assumes that $t_{RCD} \geq t_{RCD}$ (max) and $t_{RAD} \leq t_{RAD}$ (max).
5. Assumes that $t_{RCD} \leq t_{RCD}$ (max) and $t_{RAD} \geq t_{RAD}$ (max).
6. t_{OFF} (max) defines the time at which the output achieves the open circuit condition and is not referred to output voltage levels.
7. V_{IH} (min) and V_{IL} (max) are reference levels for measuring timing of input signals. Also, transition times are measured between V_{IH} and V_{IL}.
8. Operation with the t_{RCD} (max) limit insures that t_{RAC} (max) can be met, t_{RCD} (max) is specified as a reference point only, if t_{RCD} is greater than the specified t_{RCD} (max) limit, then access time is controlled exclusively by t_{CAC}.
9. Operation with the t_{RAD} (max) limit insures that t_{RAC} (max) can be met, t_{RAD} (max) is specified as a reference point only, if t_{RAD} is greater than the specified t_{RAD} (max) limit, then access time is controlled exclusively by t_{AA}.
10. t_{WCS}, t_{RWD}, t_{CWD} and t_{AWD} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only: if $t_{WCS} \geq t_{WCS}$ (min), the cycle is an early write cycle and the data out pin will remain open circuit (high impedance) throughout the entire cycle; if $t_{RWD} \geq t_{RWD}$ (min), $t_{CWD} \geq t_{CWD}$ (min), $t_{AWD} \geq t_{AWD}$ (min) and $t_{CPW} \geq t_{CPW}$ (min), the cycle is a read-modify-write and the data output will contain data read from the selected cell; if neither of the above sets of conditions is satisfied, the condition of the data out (at access time) is indeterminate.
11. These parameters are referred to $\overline{CAS}$ leading edge in an early write cycle and to $\overline{WE}$ leading edge in a delayed write or a read-modify-write cycle.
12. t_{RASC} defines $\overline{RAS}$ pulse width in fast page mode cycles.
13. Access time is determined by the longer of t_{AA} or t_{CAC} or t_{ACP}.
14. After power up pause for 100 μs, then DRAM initialization requires a minimum of eight $\overline{RAS}$ only refresh or eight $\overline{CAS}$ before $\overline{RAS}$ refresh cycles. If the user will implement $\overline{CAS}$ before $\overline{RAS}$ timing in their system, then the eight initialization cycles must be $\overline{CAS}$ before $\overline{RAS}$ cycles.
15. In delayed write or read-modify-write cycles, $\overline{OE}$ must disable output buffer prior to applying data to the device.
16. Either t_{RCH} or t_{RRH} must be satisfied for a read cycle.
17. The supply voltage with all V_{CC} pins must be on the same level.
    The supply voltage with all V_{SS} pins must be on the same level.
18. A word of data can be written only when $\overline{LWE}$ and $\overline{UWE}$ go low at the same time. This implies that early write cycles cannot be combined with delayed write cycles in the same cycles because all data is latched at the fall of the first $\overline{WE}$. In other words, staggering the $\overline{WE}$ signals in one cycle is not permitted.
19. t_{RCH}, t_{RRH}, t_{WCS}, t_{RWD}, t_{CWD} and t_{AWD} are determined by the earlier falling edge of $\overline{UWE}$ and $\overline{LWE}$.
20. t_{WCH} and t_{RCS} are determined by the later rising edge of $\overline{UWE}$ or $\overline{LWE}$.
21. t_{WP}, t_{RWL}, t_{CWL}, t_{OEH}, t_{DS}, t_{DH} and t_{CPW} should be satisfied by both $\overline{UWE}$ and $\overline{LWE}$.
22. When output buffers are enabled once, sustain the low impedance state until valid data is obtained. When output buffer is turned on and off within a very short time, generally it causes large V_{CC}/V_{SS} line noise, which causes to degrade V_{IH} (min)/V_{IL} (max) level.
23. t_{CRP} is planned to be improved to match the standard DRAM specifications.
24. If you use distributed CBR refresh mode with 15.6 μs interval in normal read/write cycle, CBR refresh should be executed within 15.6 μs immediately after exiting from and before entering into self refresh mode.
25. If you use $\overline{RAS}$ only refresh or CBR burst refresh mode in normal read/write cycle, 1024 cycles of distributed CBR refresh with 15.6 μs interval should be executed within 16 ms immediately after exiting from and before entering into the self refresh mode.
26. Repetitive self refresh mode without refreshing all memory is not allowed. Once you exit from self refresh mode, all memory cells need to be refreshed before re-entering the self refresh mode again.

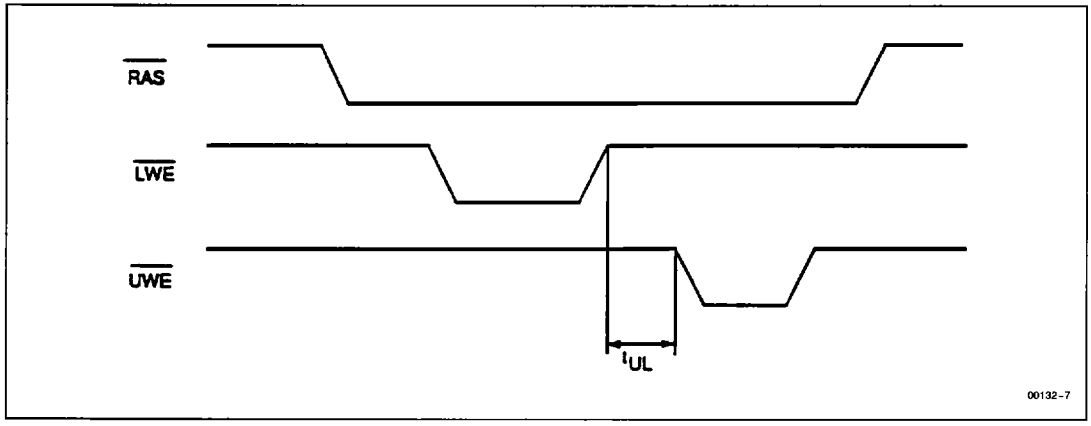
• Notes Concerning 2$\overline{WE}$ Control

Please do not intentionally separate the $\overline{UWE}$/$\overline{LWE}$ operation timing. However skews between $\overline{UWE}$/$\overline{LWE}$ are allowed under the following conditions:

(1) Each of the $\overline{UWE}$/$\overline{LWE}$ should satisfy the timing specifications individually.
(2) Different operation mode for upper/lower byte is not allowed; such as following.

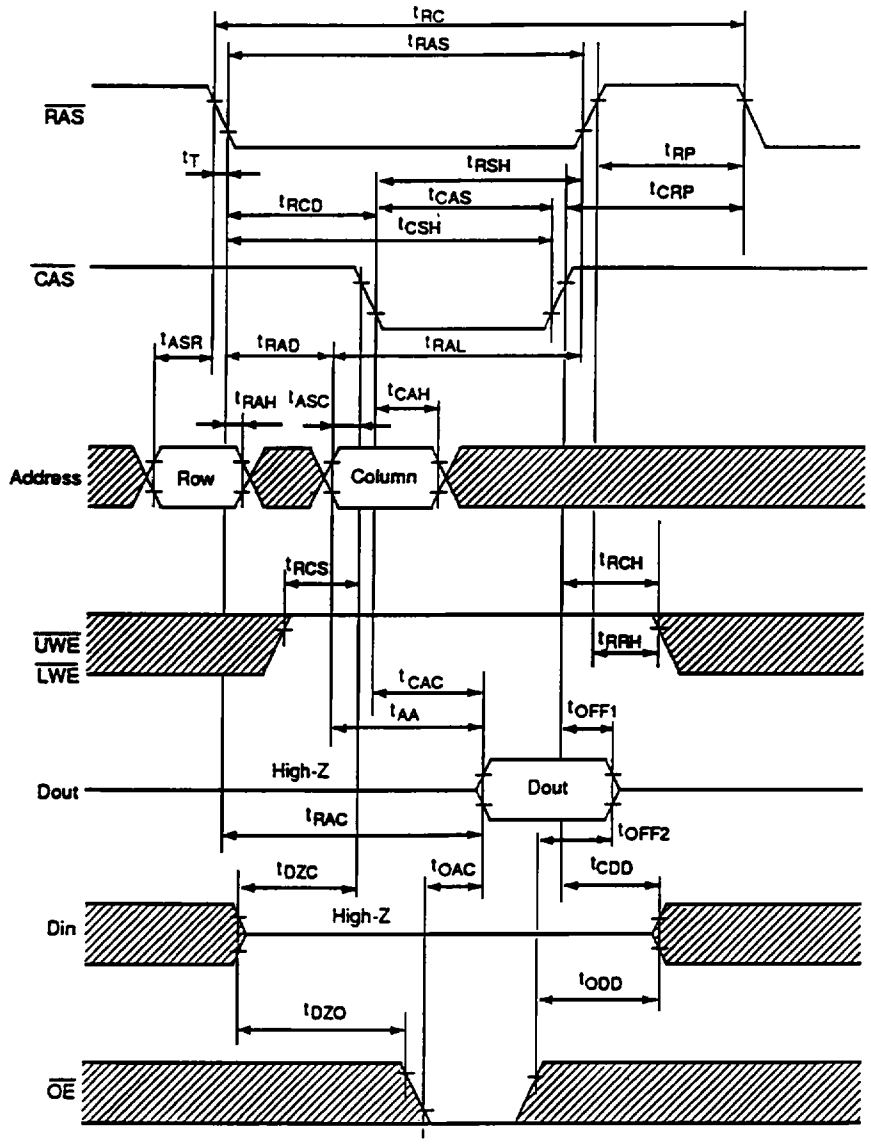


(3) Closely separated upper/lower byte control is not allowed. However when the condition ($t_{CP} \leq t_{UL}$) is satisfied, fast page mode can be performed.

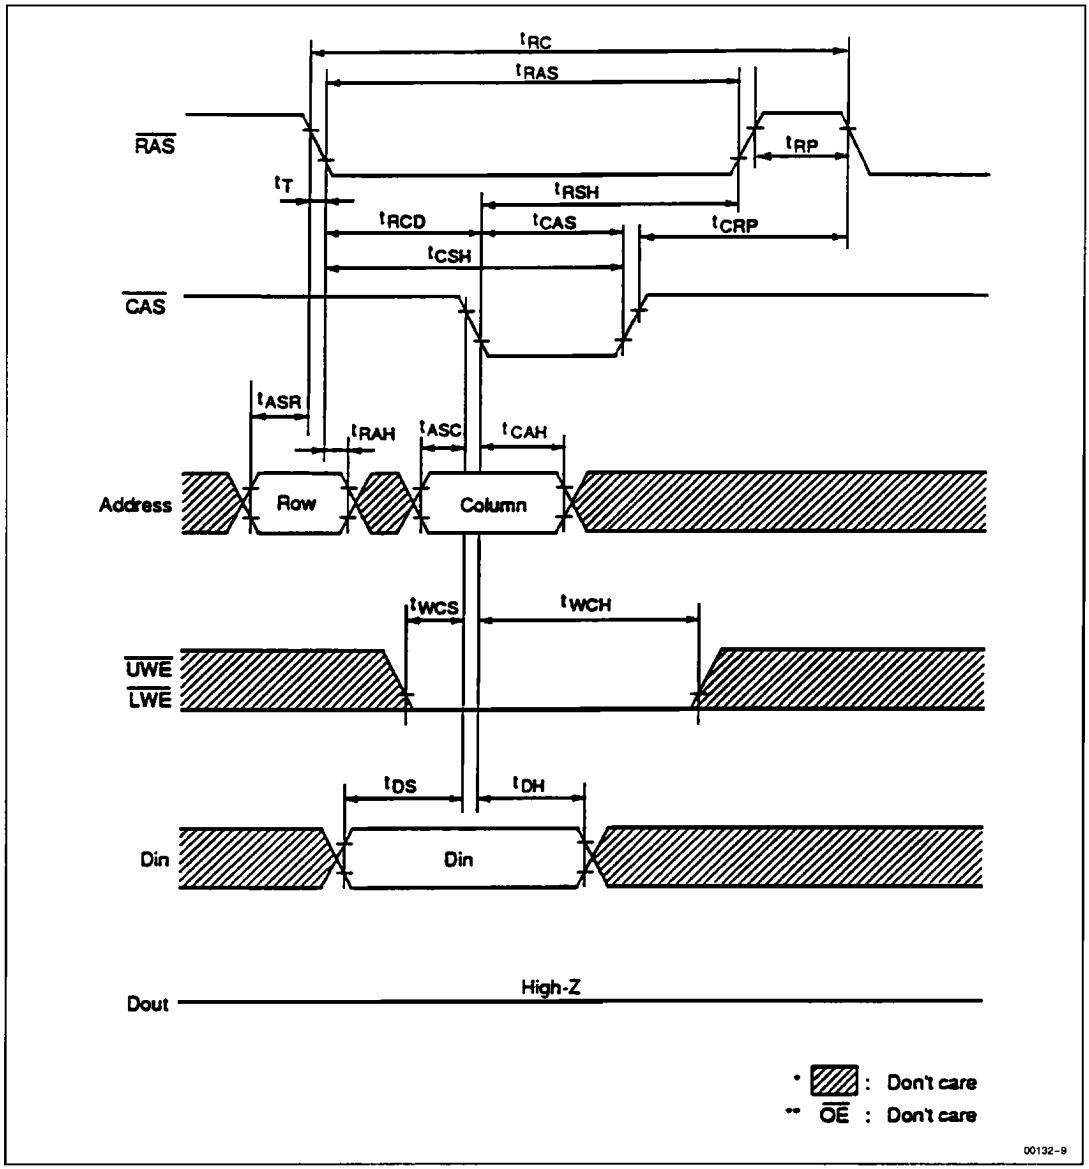


■ TIMING WAVEFORMS

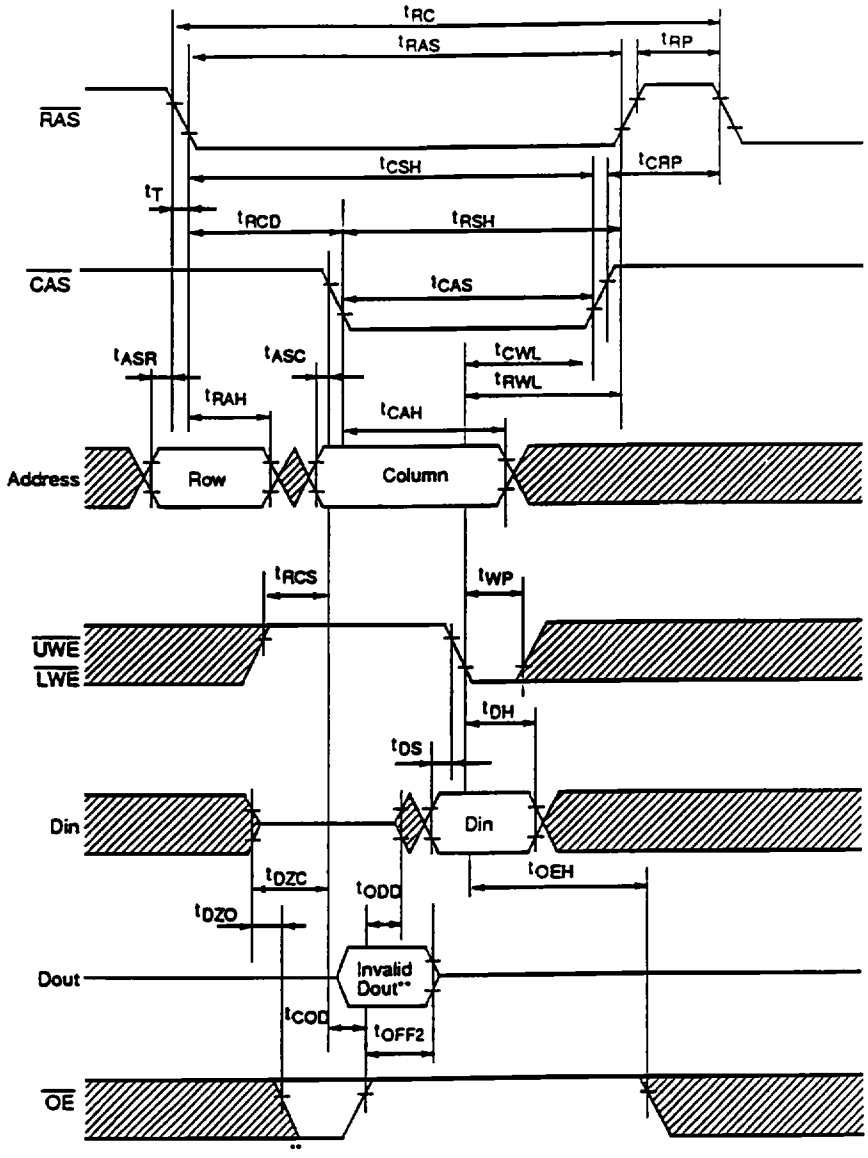
• Read Cycle/Early Write Cycle



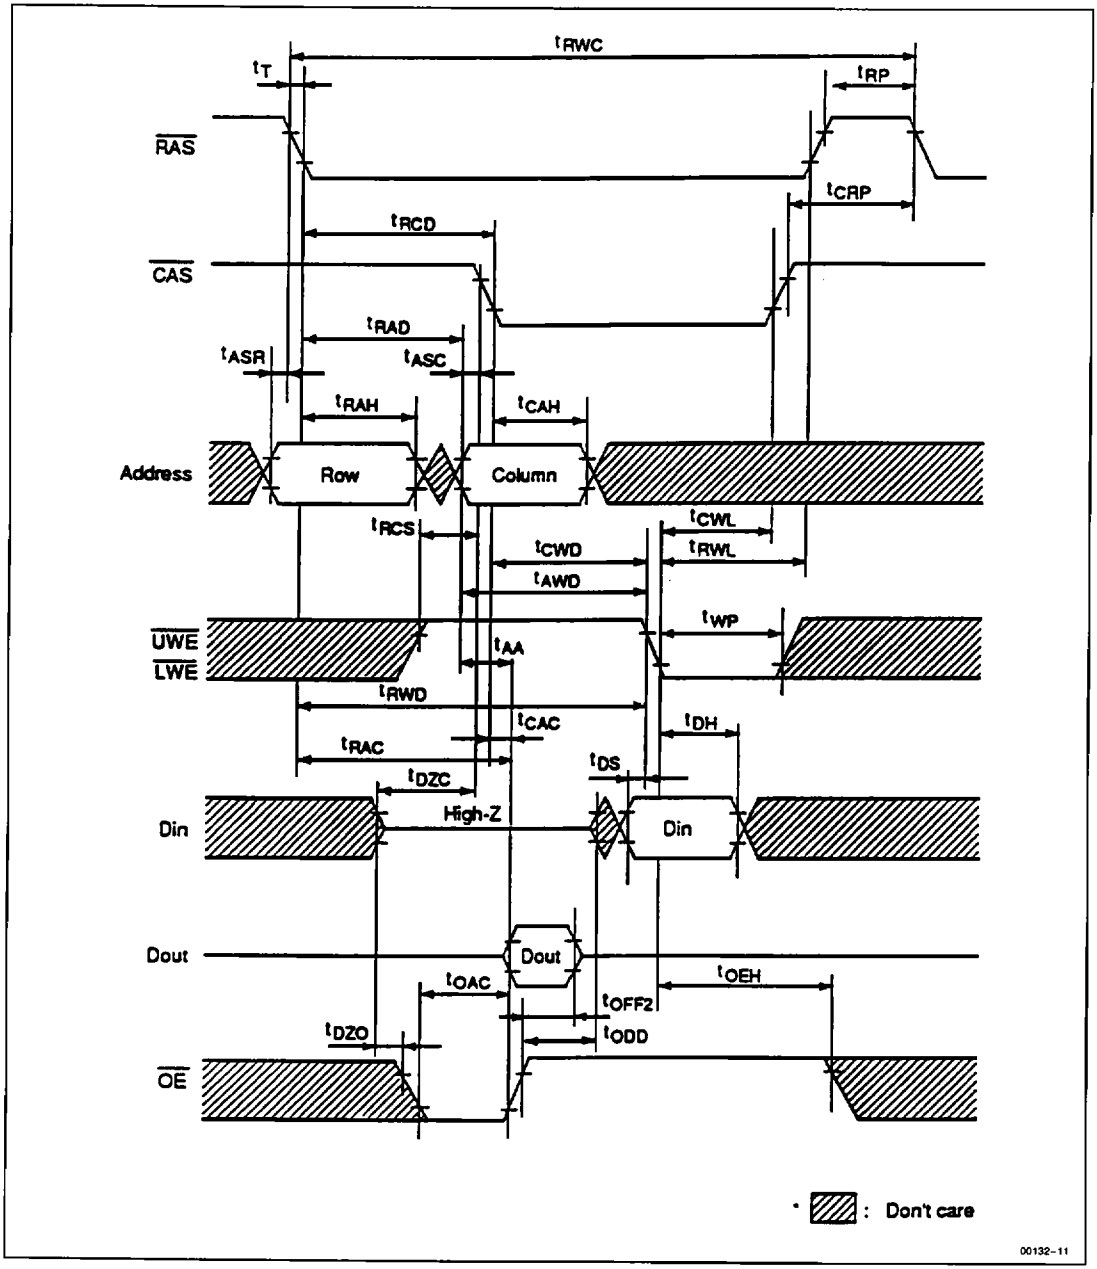
• Early Write Cycle



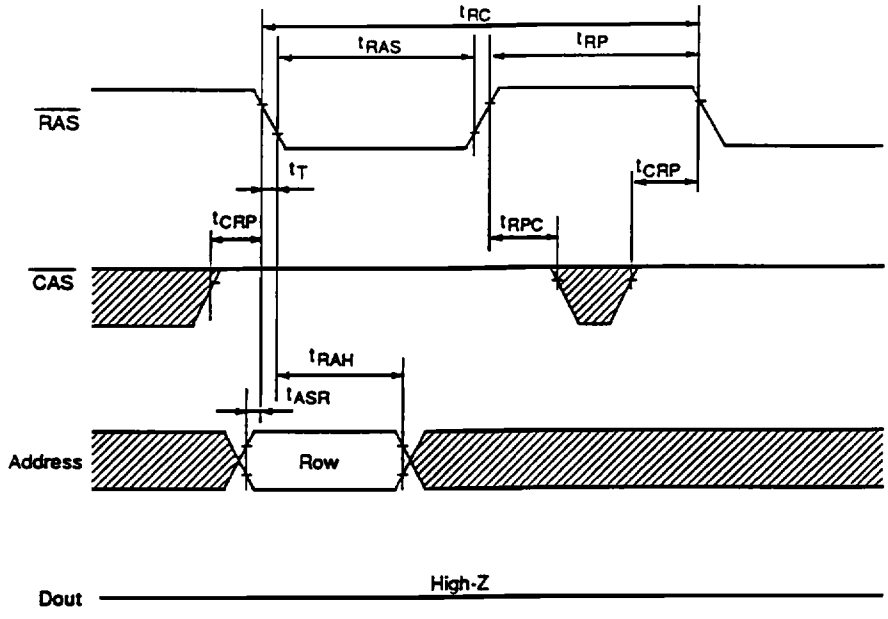
• **Delayed Write Cycle**



• **Read-Modify-Write Cycle**

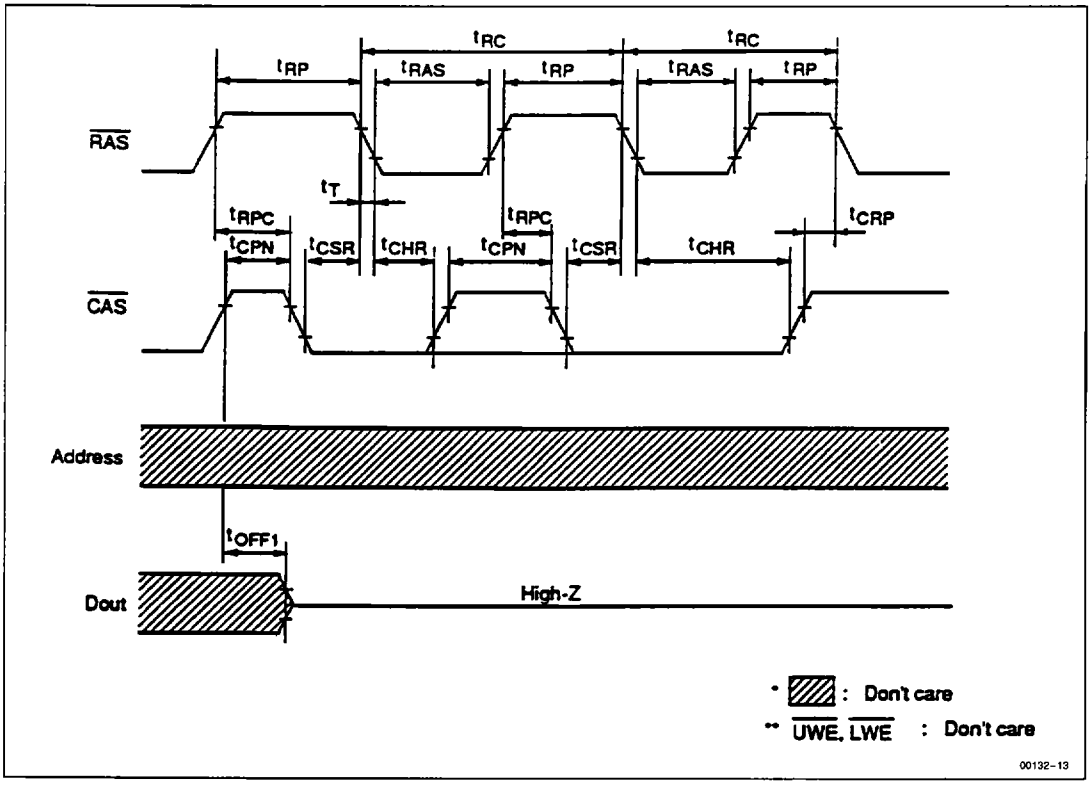


• $\overline{RAS}$ Only Refresh Cycle

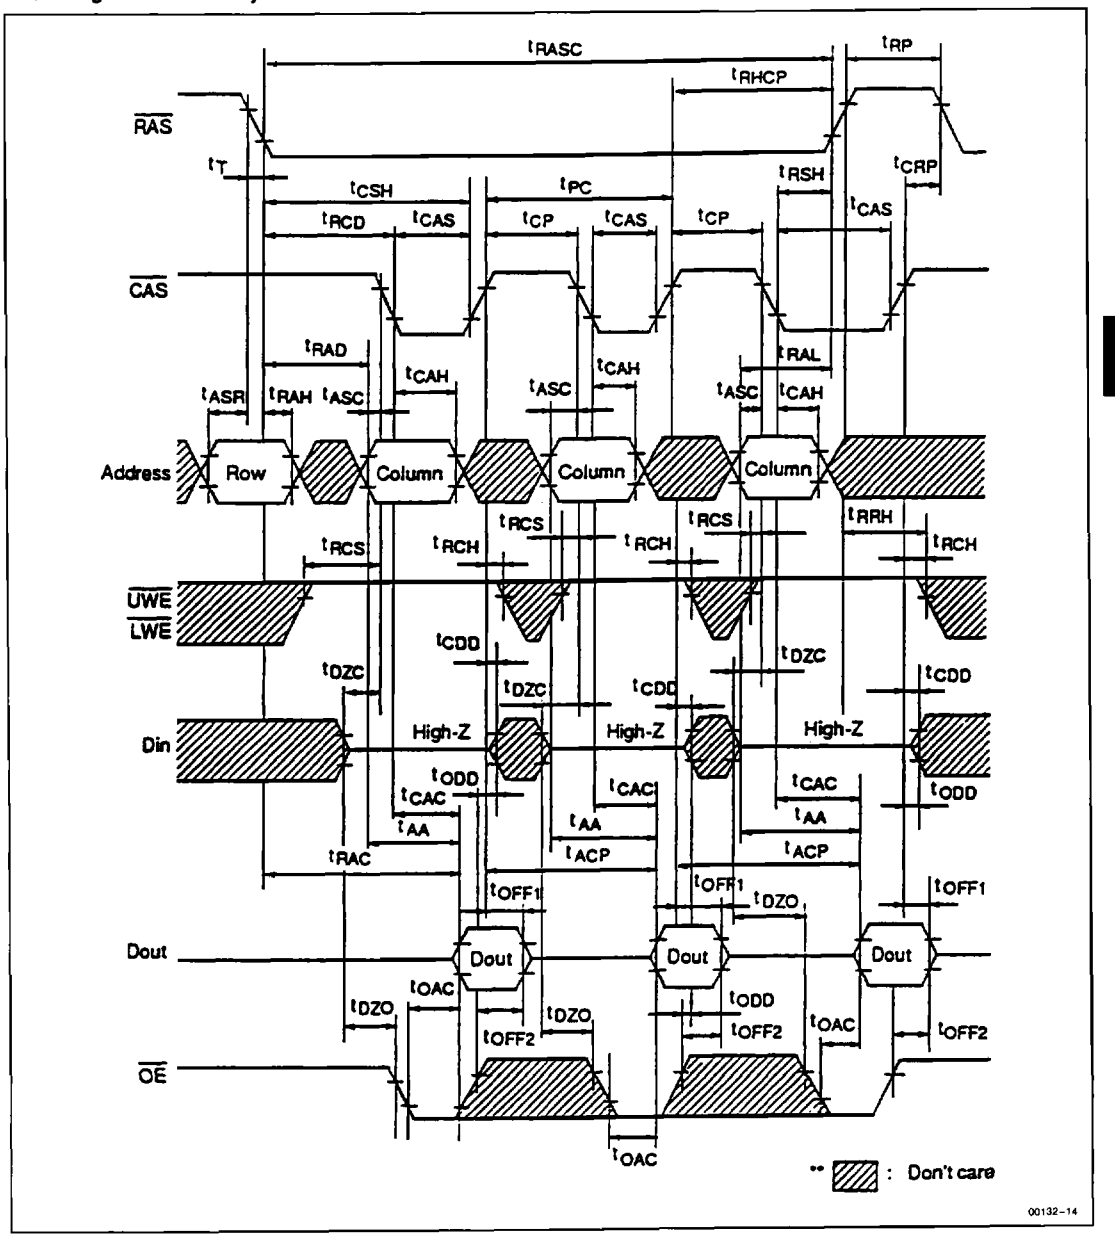


2

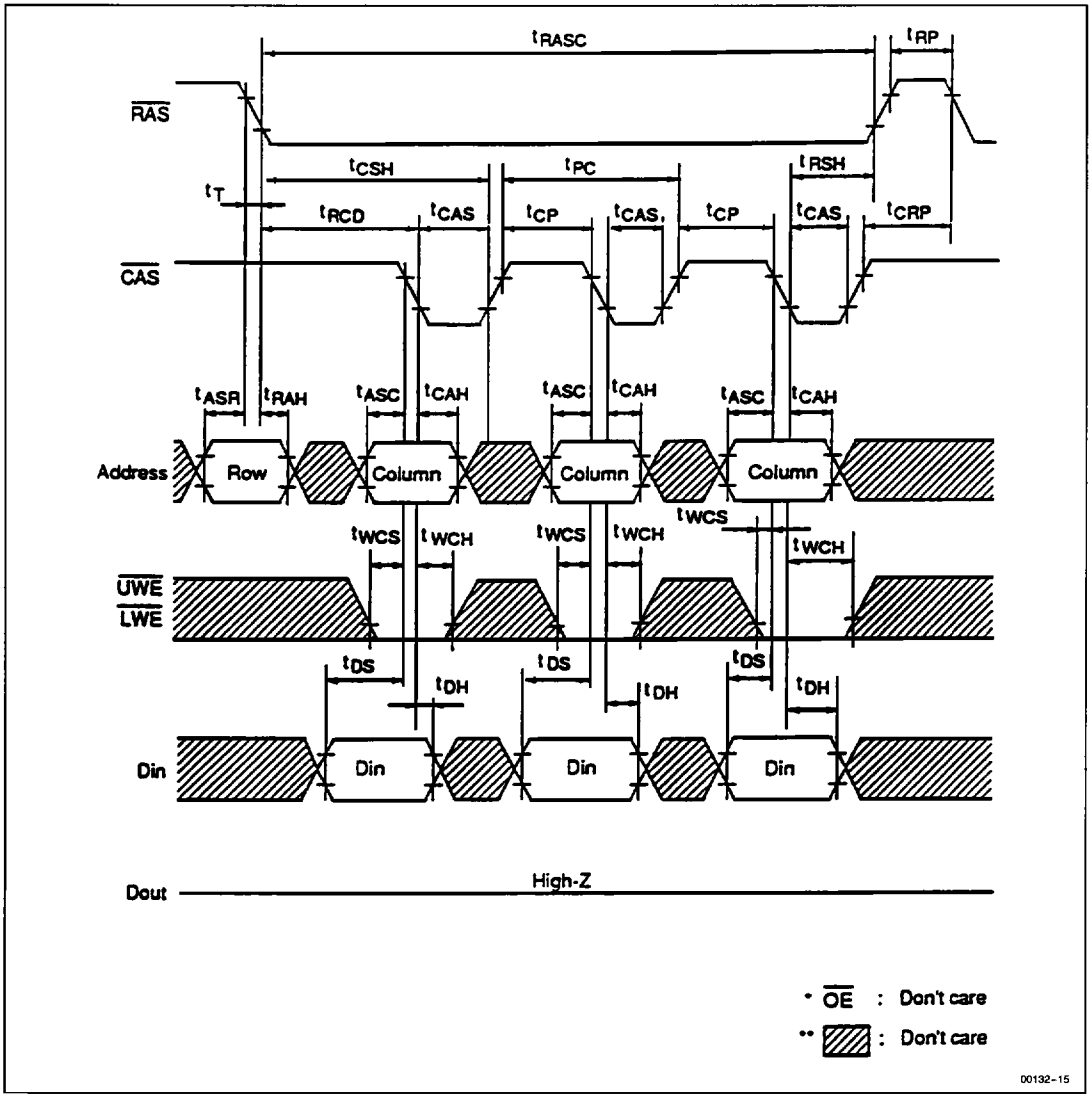
• $\overline{CAS}$ Before $\overline{RAS}$ Refresh Cycle



• **Fast Page Mode Read Cycle**

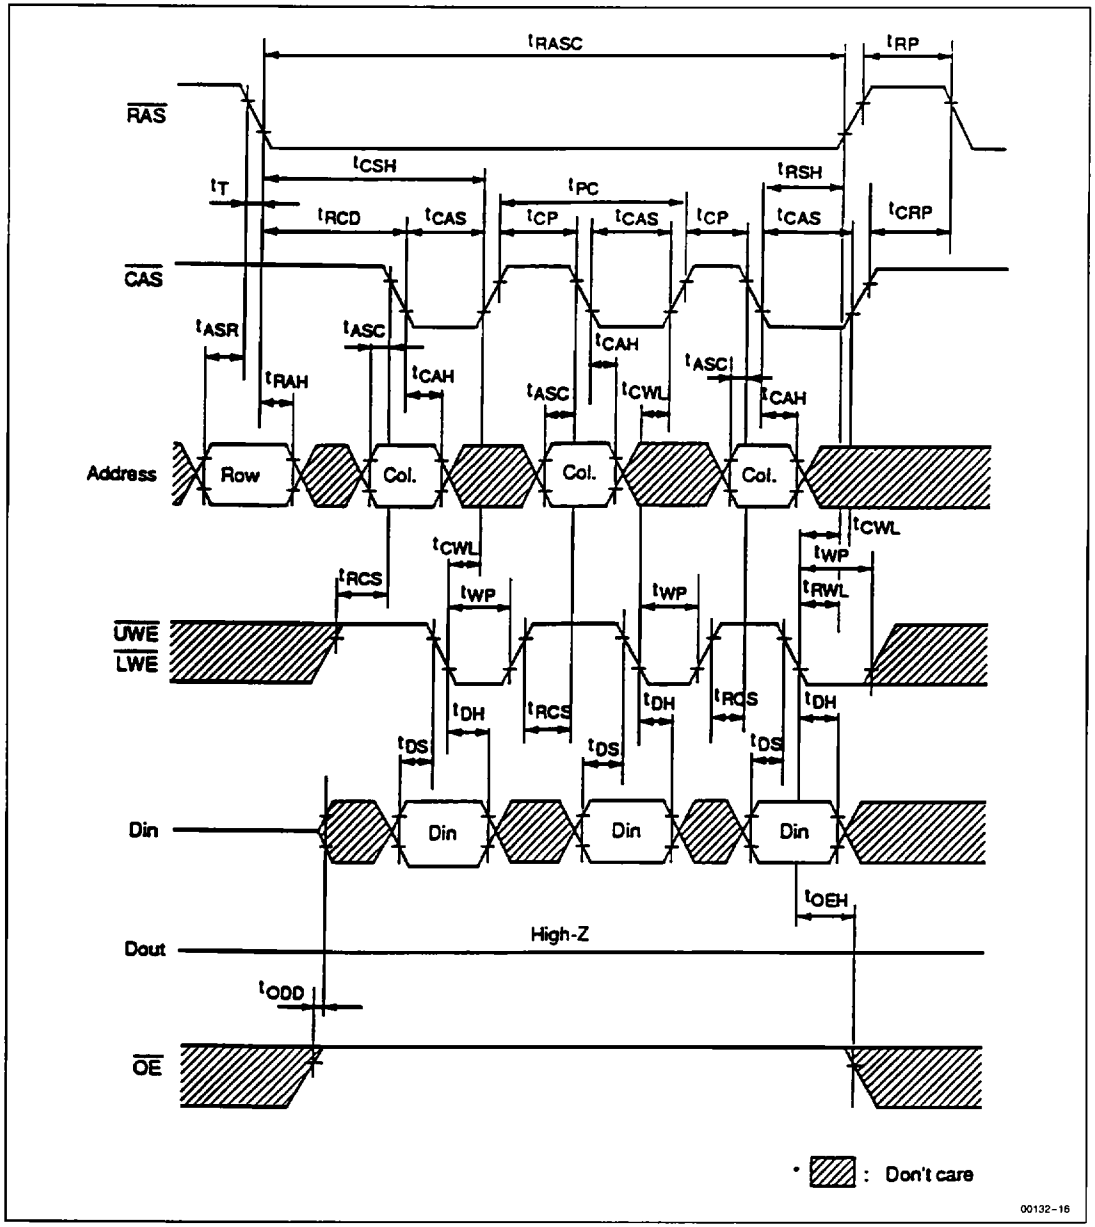


• **Fast Page Mode Early Write Cycle**

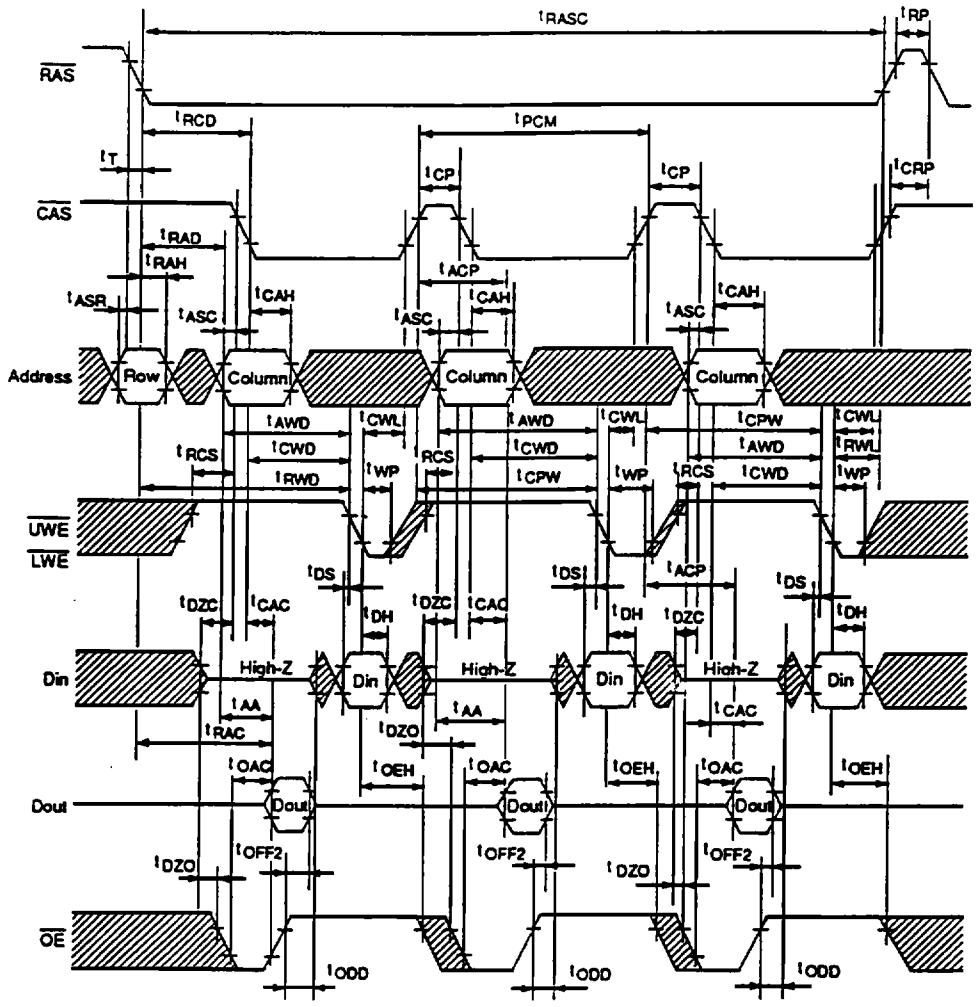


HITACHI®

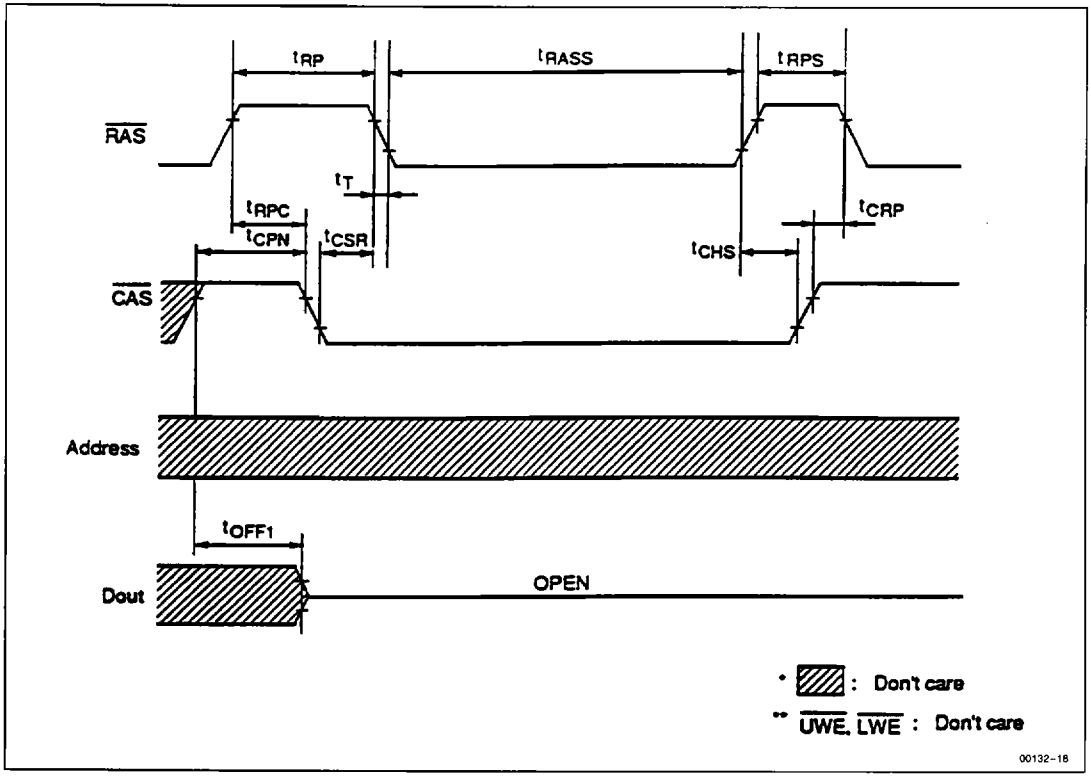
• **Fast Page Mode Delayed Write Cycle**



• **Fast Page Mode Read-Modify-Write Cycle**



• **Self Refresh Cycle**



The low self refresh current is achieved by introducing extremely long internal refresh cycle. Therefore some care needs to be taken on the refresh.

1. Please do not use t_{RASS} timing, 10 μs ≤ t_{RASS} ≤ 100 μs. During this period, the device is in transition state from normal operation mode to self refresh mode. If t_{RASS} ≥ 100 μs, then $\overline{RAS}$ precharge time should use t_{RPS} instead of t_{RP}.
2. If you use distributed CBR refresh mode with 15.6 μs interval in normal read/write cycle, CBR refresh should be executed within 15.6 μs immediately after exiting from and before entering into self refresh mode.
3. If you use $\overline{RAS}$ only refresh or CBR burst refresh mode in normal read/write cycle, 1024 cycles of distributed CBR refresh with 15.6 μs interval should be executed within 16 ms immediately after exiting from and before entering into the self refresh mode.
4. Repetitive self refresh mode without refreshing all memory is not allowed. Once you exit from self refresh mode, all memory cells need to be refreshed before re-entering the self refresh mode again.
