

# EiceDRIVER™

## 2EDL8012/3/4 & 2EDL8112/3/4

### Features

- Level-shift high-side low-side dual channel driver
- (2EDL801x) Independently controlled high-side and low-side gate drivers
- (2EDL811x) Differential input for superb robustness with inherent shoot-through protection
- 2 A/3 A/4 A source current capability for high-side/ low side drivers
- Strong 5 A high side/6 A low side sink current capability
- 120 V on-chip bootstrap diode
- Support operating frequency up to 1 MHz
- VDD/VHB under voltage lockout (UVLO)
- -10 V to 20 V Input pin capability for increased robustness
- (2EDL811x) -8V to 15 V input pin common mode rejection
- -5 A output pin reverse current capability
- 8 V to 17 V supply voltage operating range
- Fast propagation delay
- <5 ns delay matching
- Small 4 mm x 4 mm x 0.9 mm QFN package
- Lead free RoHS compliant package

FEATURE COMPARISON

PART	INPUT	LOW/HIGH SIDE PEAK PULL UP CURRENT	LOW SIDE PEAK PULL DOWN CURRENT	HIGH SIDE PEAK PULL DOWN CURRENT
2EDL8012	Independent	2A	6A	5A
2EDL8013	Independent	3A		
2EDL8014	Independent	4A		
2EDL8112	Differential	2A		
2EDL8113	Differential	3A		
2EDL8114	Differential	4A		

### Potential Applications

- DC-to-DC converter
- Low voltage motor drive
- Isolate bus converter
- Synchronous rectification for SMPS
- Solar  $\mu$ -Inverter

### Product Validation

Qualified for industrial applications according to the relevant tests of JEDEC47/20/22

### Description

2EDL8x1x is a high-side low-side driver designed for advanced switching converters such as in telecom, low voltage drive and solar applications. 2EDL801x takes in independent inputs with built-in hysteresis for enhanced noise immunity, whereas 2EDL811x takes in differential input with built-in hysteresis for enhanced noise immunity. 2EDL811x's inherent shoot-through protection ensures the robustness of the system. 4ns maximum delay matching ensures volt-second balance and avoids magnetic core saturation.

## Functional Description

### 3 Functional Description

The device is a level-shift 2-channel driver designed to support topologies with high-side and low-side configurations. The high side is level shifted by the combination of an on-chip 120V rated bootstrap diode and an external bootstrap capacitor. The device provides 2 A/3 A/4 A peak source current capability for high-side/low side drivers and strong 5 A high-side and 6 A low-side sink current capability. This allows driving large power MOSFETs with minimize switching losses during the transition through the MOSFET's Miller Plateau.

2EDL801x's input pins support TTL logic levels independently of supply voltage. They are capable to withstand voltages from -10 V to 20 V, allowing the device to interface with a broad range of analog and digital controllers. The input stage features built-in hysteresis for enhanced noise immunity. The low-side and high-side gate drivers are independently controlled and matched to typical 2 ns between the turn on and turn off of each other.

2EDL811x's input pins support TTL logic levels independently of supply voltage. They are capable to withstand voltages from -10 V to 20 V and ground potential shifts from -8 to 15V, allowing the device to interface with a broad range of analog and digital controllers. The input stage features built-in hysteresis for enhanced noise immunity. The low-side and high-side gate drivers are differentially controlled and matched to typical 1 ns between the turn on and turn off of each other. The differential inputs provide inherent shoot-through protection and ensure high-side and low-side outputs are never on at the same time.

The switching node (HS pin) is able to handle negative voltages down to  $-(24 - V_{DD})$  V which allows the high-side channel to be protected from inherent negative voltages caused parasitic inductance and stray capacitance.

Under-voltage lockout circuits are provided for both high- and low-side drivers. UVLO protects the system by forcing the output low when the supply voltage is lower than the specified threshold.

The following sections describe key functionalities.

#### 3.1 Supply Voltage

The absolute maximum supply voltage is 20 V. The minimum operating supply voltage is set by the under voltage lockout function to a typical default value of 7.0 V. This lockout function protects power MOSFETs from running into linear mode with subsequent high power dissipation.

#### 3.2 Input Control

2EDL801x device responds to the two inputs signals (HI and LI) independently according to the following truth table.

**Table 1 2EDL801x Truth Table**

LI	HI	LO	HO
L	L	L	L
H	L	H	L
L	H	L	H
H	H	H	H

The high-side and low-side outputs respond to high-side and low-side inputs independently.

2EDL811x device responds to the combination of two inputs signals (HI and LI) according to the following truth table.

## Functional Description

**Table 2 2EDL811x Truth Table**

LI	HI	LO	HO
L	L	L	L
H	L	H	L
L	H	L	H
H	H	L	L

True differential input comes with inherent shoot through protection by preventing both low and high side to be on at the same time. It also provides noise immunity against ground bounce. The input stage is designed to operate reliably against  $-8/+15$  V ground voltage drift. Input logic hysteresis also helps combat disturbances to the input signal.

### 3.3 Driver Outputs

The low output impedances allow fast transition of the load transistor. Specifically, the ultra-low impedance pull down resistances, typically  $0.6\ \Omega$  for the high side and  $0.35\ \Omega$  for the low side, keep the gate of the load transistor down during fast transient events – avoiding  $dv/dt$  induced re-turn-on.

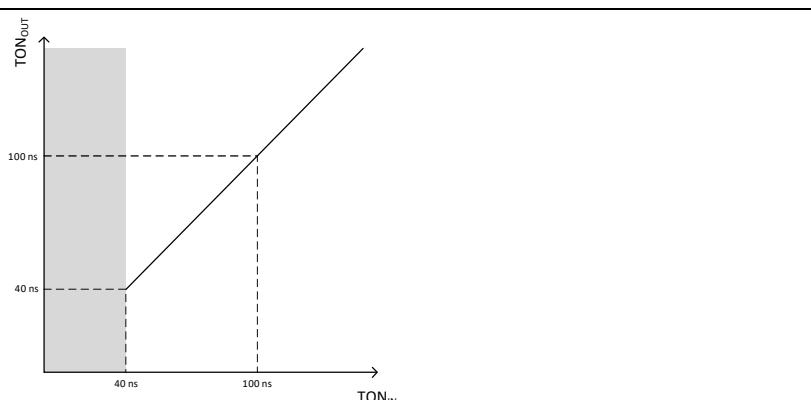

### 3.4 Under Voltage Lockout (UVLO)

The under voltage lockout function ensures that the output can be switched to its high level only if the supply voltage exceeds the UVLO rising threshold voltage. Thus it can be guaranteed, that the switch transistor is not switched on if the driving voltage is too low to completely switch on the device, thereby avoiding excessive power dissipation. The UVLO level is set to a typical value of  $7.0\text{ V}$  with  $0.5\text{ V}$  hysteresis for supply voltage ( $V_{DD}$ ) and  $5.75\text{ V}$  with  $0.25\text{ V}$  hysteresis for high side boot voltage ( $V_{HB}$ ).

UVLO threshold trigger is synchronous. The clock gating ensures minimum pulse width set by the controller is obeyed at all times. This increases robustness of the integrated boot diode due to the controllability of the reserve recovery behavior.

### 3.5 Minimum Pulse Width

The device responds to input level according to the truth table in section 3.2 as long as the logic signal complies with the minimum pulse width requirement. Signal pulse longer than the minimum allowable input pulse width yields valid output. Any output in response to shorter pulses or glitches should be disregarded and filtered out by the user. Under all allowable operation above input minimum pulse width of  $40\text{ ns}$ , the output behaves one to one to the input with minimal pulse width distortion.

**Figure 3 Minimum Pulse Width Input-output On-time Transfer Function**

**Functional Description**

This diagram is illustrative only with typical value. Actual value and pulse width distortion is subject to process variation. Output pulse width could in some case be shortened or extended to prevent retoggling. See propagation delay parameter footnote.

## Characteristics

### 4 Characteristics

#### 4.1 Absolute Maximum Ratings

Stresses above the values listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions may affect device reliability.

Symbol	Description	Min	Max	Unit
$V_{DD}$	Driver Supply Voltage <sup>1</sup>	-0.3	20	V
$V_{HS}$	Phase Voltage	$-(24 - V_{DD})$	$V_{HB} + 0.3$	V
$V_{HB}$	High Side Bootstrap Voltage	-0.3	120	V
$V_{HI}, V_{LI}$	LI and HI Input Voltage	-10	20	V
$V_{LO}$	Output voltage on LO	-0.3	$V_{DD} + 0.3$	V
$V_{HO}$	Output voltage on HO	$V_{HS} - 0.3$	$V_{HB} + 0.3$	V
$I_{OR}$	LO and HO Peak Reverse Current <sup>2</sup>	---	5	A
$T_J$	Operating Junction Temperature	-40	150	°C
$T_S$	Storage Temperature	-55	150	°C

#### 4.2 Recommended Operating Conditions

The following operating conditions must not be exceeded in order to ensure correct operation and reliability of the device. All parameters specified in the subsequent tables refer to these operating conditions.

Symbol	Description	Min	Typ	Max	Unit
$V_{HS}$	Phase Voltage to VSS	$-(24 - V_{DD})$	---	80	V
$V_{DD}$	Driver Supply Voltage	8	10	17	V
$V_{HB}$	High Side Bootstrap Voltage	-0.3	---	90	V
$T_J$	Junction Temperature	-40	---	125	°C
$dv/dt$	HS Slew Rate	---	---	50	V/ns
$V_I$	Differential Input Voltage <sup>3</sup> (2EDL811x)	0	3.3	5	V
$V_{ICMR}$	Input Signal Common Mode Rejection (2EDL811x)	$-8 + V_I/2$	---	$15 - V_I/2$	V

#### 4.3 Static Electrical Characteristics

$V_{DD} = V_{HB} = 12$  V,  $V_{HS} = V_{SS} = 0$  V.  $T_C = 25^\circ\text{C}$  unless otherwise specified. The  $V_{IN}$  and  $I_{IN}$  parameters are referenced to  $V_{SS}$ .

Symbol	Description	Min	Typ	Max	Units	Conditions
$V_{DDR}$	$V_{DD}$ UVLO Rising Threshold	6.6	7.0	7.4	V	
$V_{DDH}$	$V_{DD}$ UVLO Threshold Hysteresis	---	0.5	---	V	
$V_{HBR}$	$V_{HB}$ UVLO Rising Threshold <sup>4</sup>	5.5	5.75	6.0	V	

<sup>1</sup> All voltage ratings in this section referenced to ground.

<sup>2</sup> For <500ns pulses

<sup>3</sup> Absolute voltage difference between HI And LI ( $|V_{HI}-V_{LI}|$ )

<sup>4</sup> HB (high side bootstrap) related ratings referenced to  $V_{HS}$

## Characteristics

$T_{DRR}$	Bootstrap Diode Turn off Time <sup>1,6</sup>	---	10	---	ns	$I_F = 20 \text{ mA}$ , $I_{PRR} = 0.5 \text{ A}$

**4.5 Thermal Mechanical Characteristics**

Symbol	Description	Min	Typ	Max	Units	Conditions
$R_{thJC}$	Junction to Case Thermal Resistance	---	3	---	°C/W	Bottom
		---	46	---	°C/W	Top
$R_{thJA}$	Device on PCB	---	42	---	°C/W	6 cm <sup>2</sup> cooling area <sup>7</sup>

<sup>1</sup> Not subject to production test

<sup>2</sup> Rising propagation delay from LI to LO and from HI to HO

<sup>3</sup> A transient detector blocks the toggling of the high side output when it detects moving phase node (due to transition and/or oscillation). It prevents unwanted retoggling but may increase propagation delay. See transient detector activation in Figure 6.

<sup>4</sup> Consolidated delay matching (1) ON: between LO Rising and HO Falling and (2) OFF: between LO Falling and HO Rising

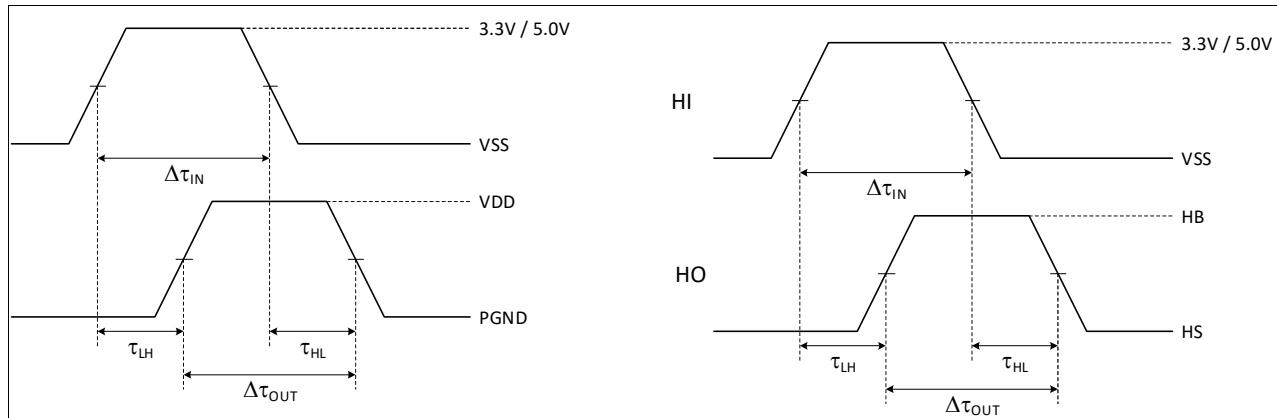

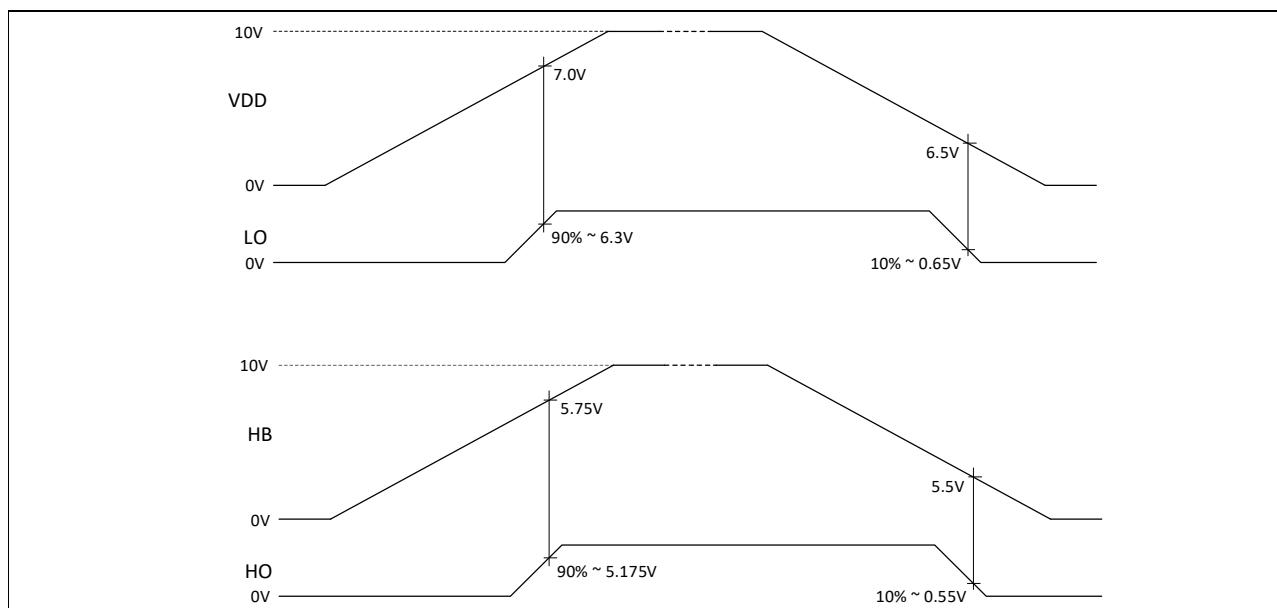

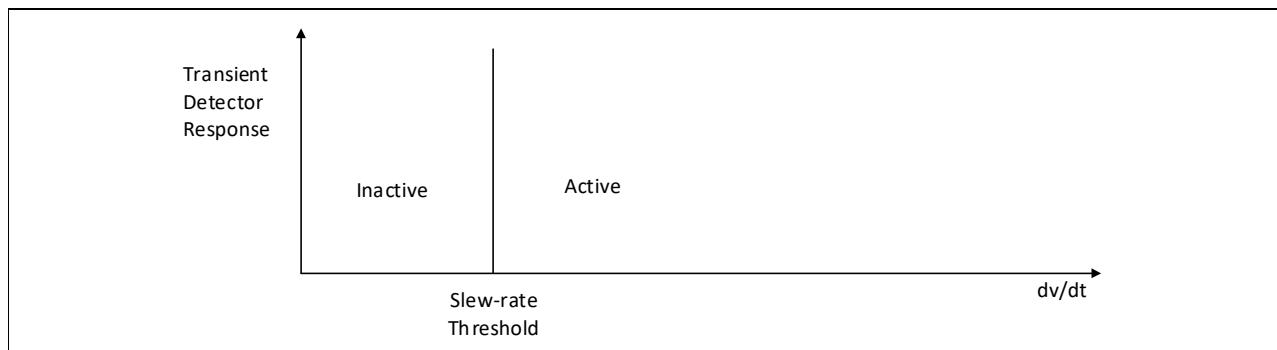

<sup>5</sup> Minimum input pulse width that produces valid output signal

<sup>6</sup> External schottky boot diode in parallel recommended for high dv/dt application

<sup>7</sup> Device on 40 mm x 40 mm x 1.5 mm epoxy PCB FR4 with 6cm<sup>2</sup> (one layer, 70µm thick) copper area for drain connection. PCB vertical in still air.
