

# Intel® LXT971A

## 3.3V Dual-Speed Fast Ethernet PHY Transceiver

---

### Datasheet

The LXT971A is an IEEE compliant Fast Ethernet PHY Transceiver that directly supports both 100BASE-TX and 10BASE-T applications. It provides a Media Independent Interface (MII) for easy attachment to 10/100 Media Access Controllers (MACs). The LXT971A also provides a Low Voltage PECL (LVPECL) interface for use with 100BASE-FX fiber networks.

This document also supports the LXT971 device.

The LXT971A supports full-duplex operation at 10 Mbps and 100 Mbps. Its operating condition can be set using auto-negotiation, parallel detection, or manual control.

The LXT971A is fabricated with an advanced CMOS process and requires only a single 3.3V power supply.

## Applications

- Combination 10BASE-T/100BASE-TX or 100BASE-FX Network Interface Cards (NICs)
- 10/100 PCMCIA Cards
- Cable Modems and Set-Top Boxes

## Product Features

- 3.3V Operation.
- Low power consumption (300 mW typical).
- Low-power “Sleep” mode.
- 10BASE-T and 100BASE-TX using a single RJ-45 connection.
- Supports auto-negotiation and parallel detection.
- MII interface with extended register capability.
- Robust baseline wander correction performance.
- 100BASE-FX fiber-optic capable.
- Standard CSMA/CD or full-duplex operation.
- Supports JTAG boundary scan.
- Configurable via MDIO serial port or hardware control pins.
- Integrated, programmable LED drivers.
- 64-ball Plastic Ball Grid Array (PBGA).
  - LXT971ABC - Commercial (0° to 70°C ambient).
  - LXT971ABE - Extended (-40° to 85°C ambient).
- 64-pin Low-profile Quad Flat Package (LQFP).
  - LXT971ALC - Commercial (0° to 70°C ambient).
  - LXT971ALE - Extended (-40° to 85°C ambient).

## Revision History

<b>Revision 002</b> <b>Revision Date: August 6, 2002</b>	
<b>Page</b>	<b>Description</b>
	Globally replaced "pseudo-PECL" with Low-Voltage PECL", except when identified with 5 V.
1	Front Page: Changed "pseudo-ECL (PECL)" to "Low Voltage PECL (LVPECL). Added "JTAG Boundary Scan" to Product Features on front page.
12	Modified <a href="#">Figure 2 "LXT971A 64-Ball PBGA Assignments"</a> (replaced TEST1 and TEST0 with GND).
13	Modified <a href="#">Figure 3 "LXT971A 64-Pin LQFP Assignments"</a> (replaced TEST1 and TEST0 with GND).
14	Modified <a href="#">Table 1 "LQFP Numeric Pin List"</a> (replaced TEST1 and TEST0 with GND).
16	Added note under <a href="#">Section 2.0, "Signal Descriptions"</a> : "Intel recommends that all inputs and multi-function pins be tied to the inactive states and all outputs be left floating, if unused."
17	Modified SD/TP description in <a href="#">Table 3 "LXT971A Network Interface Signal Descriptions"</a> . Added Table note 2.
18	Modified <a href="#">Table 4 "LXT971A Miscellaneous Signal Descriptions"</a> .
19	Modified <a href="#">Table 5 "LXT971A Power Supply Signal Descriptions"</a> .
20	Added <a href="#">Table 8 "LXT971A Pin Types and Modes"</a> .
22	Replaced second paragraph under <a href="#">Section 3.2.1.2, "Fiber Interface"</a> .
23	Added <a href="#">Section 3.2.2.1, "Increased MII Drive Strength"</a> .
23	Changed "Far-End Fault" title to "100BASE-FX Far-End Fault". Modified first sentence under this heading.
30	Modified <a href="#">Figure 8 "Hardware Configuration Settings"</a> .
35	Added paragraph after bullets under <a href="#">Section 3.6.7.2, "Test Loopback"</a> .
43	Modified text under <a href="#">Section 3.7.3.4, "Fiber PMD Sublayer"</a> .
47	Modified <a href="#">Table 13 "Supported JTAG Instructions"</a> .
47	Modified <a href="#">Table 14 "Device ID Register"</a> .
52	Added a new <a href="#">Section 4.3, "The Fiber Interface"</a> .
53	Replaced <a href="#">Figure 25 "Typical LXT971A-to-3.3 V Fiber Transceiver Interface Circuitry"</a> .
54	Added <a href="#">Figure 26 "Typical LXT971A-to-5 V Fiber Transceiver Interface Circuitry"</a> .
55	Added <a href="#">Figure 27 "ON Semiconductor Triple PECL-to-LVPECL Translator"</a> .
56	Modified <a href="#">Table 17 "Absolute Maximum Ratings"</a> .
56	Modified <a href="#">Table 18 "Operating Conditions"</a> : Added Typ values to Vcc current.
57	Modified <a href="#">Table 20 "Digital I/O Characteristics - MII Pins"</a> .
58	Modified <a href="#">Table 22 "I/O Characteristics - LED/CFG Pins"</a> .
58	Added <a href="#">Table 23 "I/O Characteristics - SD/TP Pin"</a> .
60	Added <a href="#">Table 28 "LXT971A Thermal Characteristics"</a> .
65	Modified <a href="#">Table 33 "10BASE-T Receive Timing Parameters"</a> .
72	Modified <a href="#">Table 42 "Register Bit Map"</a> . (Added Table 26 information).
86	Added <a href="#">Table 57 "Digital Config Register (Address 26)"</a> .
87	Modified <a href="#">Table 58 "Transmit Control Register (Address 30)"</a> .
90	Added <a href="#">Section 8.0, "Product Ordering Information"</a> .

<b>Revision 001</b> <b>Revision Date: January 2001</b>	
<b>Page</b>	<b>Description</b>
N/A	Clock Requirements: Modified language under Clock Requirements heading.
	Table 21 I/O Characteristics REFCLK: Changed values for Input Clock Duty Cycle under Min from 40 to 35 and under Max from 60 to 65.

## 2.0 Signal Descriptions

**Note:** Intel recommends that all inputs and multi-function pins be tied to the inactive states and all outputs be left floating, if unused.

**Table 2. LXT971A MII Signal Descriptions**

PBGA Pin#	LQFP Pin#	Symbol	Type <sup>1</sup>	Signal Description
<b>Data Interface Pins</b>				
A3 B3 C4 A4	60 59 58 57	TXD3 TXD2 TXD1 TXD0	I	<b>Transmit Data.</b> TXD is a bundle of parallel data signals that are driven by the MAC. TXD<3:0> transitions synchronously with respect to the TX_CLK. TXD<0> is the least significant bit.
B4	56	TX_EN	I	<b>Transmit Enable.</b> The MAC asserts this signal when it drives valid data on TXD. This signal must be synchronized to TX_CLK.
C5	55	TX_CLK	O	<b>Transmit Clock.</b> TX_CLK is sourced by the PHY in both 10 and 100 Mbps operations. 2.5 MHz for 10 Mbps operation, 25 MHz for 100 Mbps operation.
D6 C8 B8 A8	45 46 47 48	RXD3 RXD2 RXD1 RXD0	O	<b>Receive Data.</b> RXD is a bundle of parallel signals that transition synchronously with respect to the RX_CLK. RXD<0> is the least significant bit.
A7	49	RX_DV	O	<b>Receive Data Valid.</b> The LXT971A asserts this signal when it drives valid data on RXD. This output is synchronous to RX_CLK.
A5	53	RX_ER	O	<b>Receive Error.</b> Signals a receive error condition has occurred. This output is synchronous to RX_CLK.
B5	54	TX_ER	I	<b>Transmit Error.</b> Signals a transmit error condition. This signal must be synchronized to TX_CLK.
B6	52	RX_CLK	O	<b>Receive Clock.</b> 25 MHz for 100 Mbps operation, 2.5 MHz for 10 Mbps operation. Refer to "Clock Requirements" on page 26 in Section 3.0, "Functional Description".
B2	62	COL	O	<b>Collision Detected.</b> The LXT971A asserts this output when a collision is detected. This output remains High for the duration of the collision. This signal is asynchronous and is inactive during full-duplex operation.
A2	63	CRS	O	<b>Carrier Sense.</b> During half-duplex operation (Register bit 0.8 = 0), the LXT971A asserts this output when either transmitting or receiving data packets. During full-duplex operation (Register bit 0.8 = 1), CRS is asserted only during receive. CRS assertion is asynchronous with respect to RX_CLK. CRS is de-asserted on loss of carrier, synchronous to RX_CLK.
1. Type Column Coding: I = Input, O = Output, A = Analog, OD = Open Drain				

**Table 2. LXT971A MII Signal Descriptions (Continued)**

PBGA Pin#	LQFP Pin#	Symbol	Type <sup>1</sup>	Signal Description
<b>MI Control Interface Pins</b>				
D3	3	MDDIS	I	<b>Management Disable.</b> When MDDIS is High, the MDIO is disabled from read and write operations. When MDDIS is Low at power-up or reset, the Hardware Control Interface pins control only the initial or “default” values of their respective register bits. After the power-up/reset cycle is complete, bit control reverts to the MDIO serial channel.
E7	43	MDC	I	<b>Management Data Clock.</b> Clock for the MDIO serial data channel. Maximum frequency is 8 MHz.
D8	42	MDIO	I/O	<b>Management Data Input/Output.</b> Bidirectional serial data channel for PHY/STA communication.
A1	64	$\overline{\text{MDINT}}$	OD	<b>Management Data Interrupt.</b> When Register bit 18.1 = 1, an active Low output on this pin indicates status change. Interrupt is cleared by reading Register 19.
1. Type Column Coding: I = Input, O = Output, A = Analog, OD = Open Drain				

**Table 3. LXT971A Network Interface Signal Descriptions**

PBGA Pin#	LQFP Pin#	Symbol	Type <sup>1</sup>	Signal Description
H2 H3	19 20	TPFOP TPFON	O	Twisted-Pair/Fiber Outputs, Positive & Negative. During 100BASE-TX or 10BASE-T operation, TPFOP/N pins drive 802.3 compliant pulses onto the line. During 100BASE-FX operation, TPFOP/N pins produce differential LVPECL outputs for fiber transceivers.
H4 H5	23 24	TPFIP TPFIN	I	Twisted-Pair/Fiber Inputs, Positive & Negative. During 100BASE-TX or 10BASE-T operation, TPFIP/N pins receive differential 100BASE-TX or 10BASE-T signals from the line. During 100BASE-FX operation, TPFIP/N pins receive differential LVPECL inputs from fiber transceivers.
G2	26	$\overline{\text{SD/TP}}$	I	<b>Signal Detect<sup>2</sup>:</b> Dual function input depending on the state of the device. <b>Reset and Power-Up.</b> Media mode selection: Tie High for FX mode (Register bit 16.0 = 1) Tie Low for TP mode (Register bit 16.0 = 0) <b>Normal Operation (FX Mode):</b> SD input from the fiber transceiver. <b>Normal Operation (TP Mode):</b> Tie to GND (uses an internal pull-down).
1. Type Column Coding: I = Input, O = Output, A = Analog, OD = Open Drain 2. For standard digital loopback testing (Register bit 0.14) in FX mode, the SD pin should be tied to an LVPECL logic High (2.4 V).				

Table 4. LXT971A Miscellaneous Signal Descriptions

PBGA Pin#	LQFP Pin#	Symbol	Type <sup>1</sup>	Signal Description		
D1 D2	5 6	TxSLEW0 TxSLEW1	I	<b>Tx Output Slew Controls 0 and 1.</b> These pins select the TX output slew rate (rise and fall time) as follows:		
				TxSLEW1	TxSLEW0	Slew Rate (Rise and Fall Time)

DL = Driven Low (Logic 0), DH = Driven High (Logic 1), IPLD = Internal Pull-Down (Weak)									

## 3.0 Functional Description

---

### 3.1 Introduction

The LXT971A is a single-port Fast Ethernet 10/100 transceiver that supports 10 Mbps and 100 Mbps networks and complies with all applicable requirements of IEEE 802.3. The LXT971A directly drives either a 100BASE-TX line (up to 140 meters) or a 10BASE-T line (up to 185 meters). The device also supports 100BASE-FX operation via a Low Voltage PECL (LVPECL) interface.

#### 3.1.1 Comprehensive Functionality

The LXT971A provides a standard Media Independent Interface (MII) for 10/100 MACs. The LXT971A performs all functions of the Physical Coding Sublayer (PCS) and Physical Media Attachment (PMA) sublayer as defined in the IEEE 802.3 100BASE-X standard. This device also performs all functions of the Physical Media Dependent (PMD) sublayer for 100BASE-TX connections.

The LXT971A reads its configuration pins on power-up to check for forced operation settings. If not configured for forced operation, the device uses auto-negotiation/parallel detection to automatically determine line operating conditions. If the PHY device on the other side of the link supports auto-negotiation, the LXT971A auto-negotiates with it using Fast Link Pulse (FLP) Bursts. If the PHY partner does not support auto-negotiation, the LXT971A automatically detects the presence of either link pulses (10 Mbps PHY) or Idle symbols (100 Mbps PHY) and sets its operating conditions accordingly.

The LXT971A provides half-duplex and full-duplex operation at 100 Mbps and 10 Mbps.

#### 3.1.2 OSP™ Architecture

The LXT971A incorporates high-efficiency Optimal Signal Processing™ design techniques, combining the best properties of digital and analog signal processing to produce a truly optimal device.

The receiver utilizes decision feedback equalization to increase noise and cross-talk immunity by as much as 3 dB over an ideal all-analog equalizer. Using OSP mixed-signal processing techniques in the receive equalizer avoids the quantization noise and calculation truncation errors found in traditional DSP-based receivers (typically complex DSP engines with A/D converters). This results in improved receiver noise and cross-talk performance.

The OSP signal processing scheme also requires substantially less computational logic than traditional DSP-based designs. This lowers power consumption and also reduces the logic switching noise generated by DSP engines. This logic switching noise can be a considerable source of EMI generated on the device's power supplies.

The OSP-based LXT971A provides improved data recovery, EMI performance and low power consumption.

## 3.2 Network Media / Protocol Support

The LXT971A supports both 10BASE-T and 100BASE-TX Ethernet over twisted-pair, or 100 Mbps Ethernet over fiber media (100BASE-FX).

### 3.2.1 10/100 Network Interface

The network interface port consists of five external pins (two differential signal pairs and a signal detect pin). The I/O pins are shared between twisted-pair (TP) and fiber. Refer to [Figure 3 on page 13](#) for specific pin assignments.

The LXT971A output drivers generate either 100BASE-TX, 10BASE-T, or 100BASE-FX output. When not transmitting data, the LXT971A generates 802.3-compliant link pulses or idle code. Input signals are decoded either as a 100BASE-TX, 100BASE-FX, or 10BASE-T input, depending on the mode selected. Auto-negotiation/parallel detection or manual control is used to determine the speed of this interface.

#### 3.2.1.1 Twisted-Pair Interface

The LXT971A supports either 100BASE-TX or 10BASE-T connections over 100 $\Omega$ , Category 5, Unshielded Twisted Pair (UTP) cable. When operating at 100 Mbps, the LXT971A continuously transmits and receives MLT3 symbols. When not transmitting data, the LXT971A generates “IDLE” symbols.

During 10 Mbps operation, Manchester-encoded data is exchanged. When no data is being exchanged, the line is left in an idle state. Link pulses are transmitted periodically to keep the link up.

Only a transformer, RJ-45 connector, load resistor, and bypass capacitors are required to complete this interface. On the transmit side, the LXT971A has an active internal termination and does not require external termination resistors. Intel's patented waveshaping technology shapes the outgoing signal to help reduce the need for external EMI filters. Four slew rate settings (refer to [Table 4 on page 18](#)) allow the designer to match the output waveform to the magnetic characteristics. On the receive side, the internal impedance is high enough that it has no practical effect on the external termination circuit.

#### 3.2.1.2 Fiber Interface

The LXT971A fiber port is designed to interface with common industry-standard fiber modules. It incorporates a Low Voltage PECL interface that complies with the ANSI X3.166 standard for seamless integration.

Fiber mode is selected through Register bit 16.0 by the following two methods:

1. Drive the SD input to a value greater than 600 mV during power-up and reset states (all LVPECL signaling levels from a fiber transceiver are acceptable).
2. Configure Register bit 16.0 = 1 through the MDIO interface.

### 3.2.1.3 Fault Detection and Reporting

The LXT971A supports two fault detection and reporting mechanisms. “Remote Fault” refers to a MAC-to-MAC communication function that is essentially transparent to PHY layer devices. It is used only during auto-negotiation, and is applicable only to twisted-pair links. “Far-End Fault” is an optional PMA-layer function that may be embedded within PHY devices. The LXT971A supports both functions (see [Section 3.2.1.3.1](#) and [Section 3.2.1.3.2](#)).

#### 3.2.1.3.1 Remote Fault

Register bit 4.13 in the Auto-Negotiation Advertisement Register is reserved for Remote Fault indications. It is typically used when re-starting the auto-negotiation sequence to indicate to the link partner that the link is down because the advertising device detected a fault.

When the LXT971A receives a Remote Fault indication from its partner during auto-negotiation it does the following:

- Sets Register bit 5.13 in the Link Partner Base Page Ability Register, and
- Sets the Remote Fault Register bit 1.4 in the MII Status Register to pass this information to the local controller.

#### 3.2.1.3.2 100BASE-FX Far-End Fault

The SD/ $\overline{\text{TP}}$  pin monitors signal quality during normal operation in fiber mode. If the signal quality degrades beyond the fault threshold, the fiber transceiver reports a signal quality fault condition via the SD/ $\overline{\text{TP}}$  pin. Loss of signal quality blocks any fiber data from being received and causes a link loss.

If the LXT971A detects a signal fault condition, it can transmit the Far-End Fault Indication (FEFI) over the fiber link. The FEFI consists of 84 consecutive ones followed by a single zero. This pattern must be repeated at least three times. The LXT971A transmits the far-end fault code a minimum of three times if all the following conditions are true:

- Fiber mode is selected.
- Fault Code transmission is enabled (Register bit 16.2 = 1).
- Either Signal Detect indicates no signal or the receive PLL cannot lock.
- Loopback is not enabled.

## 3.2.2 MII Data Interface

The LXT971A supports a standard Media Independent Interface (MII). The MII consists of a data interface and a management interface. The MII Data Interface passes data between the LXT971A and a Media Access Controller (MAC). Separate parallel buses are provided for transmit and receive. This interface operates at either 10 Mbps or 100 Mbps. The speed is set automatically, once the operating conditions of the network link have been determined. Refer to “[MII Operation](#)” on [page 32](#) for additional details.

### 3.2.2.1 Increased MII Drive Strength

A higher Media Independent Interface (MII) drive strength may be desired in some designs to drive signals over longer PCB trace lengths, or over high-capacitive loads, through multiple vias, or through a connector. The MII drive strength in the LXT971A can be increased by setting Register

bit 26.11 through software control. Setting Register bit 26.11 = 1 through the MDC/MDIO interface sets the MII pins (RXD[0:3], RX\_DV, RX\_CLK, RX\_ER, COL, CRS, and TX\_CLK) to a higher drive strength.

### 3.2.3 Configuration Management Interface

The LXT971A provides both an MDIO interface and a Hardware Control Interface for device configuration and management.

#### 3.2.3.1 MDIO Management Interface

The LXT971A supports the IEEE 802.3 MII Management Interface also known as the Management Data Input/Output (MDIO) Interface. This interface allows upper-layer devices to monitor and control the state of the LXT971A. The MDIO interface consists of a physical connection, a specific protocol that runs across the connection, and an internal set of addressable registers.

Some registers are required and their functions are defined by the IEEE 802.3 standard. The LXT971A also supports additional registers for expanded functionality. The LXT971A supports multiple internal registers, each of which is 16 bits wide. Specific register bits are referenced using an “X.Y” notation, where X is the register number (0-31) and Y is the bit number (0-15).

The physical interface consists of a data line (MDIO) and clock line (MDC). Operation of this interface is controlled by the MDDIS input pin. When MDDIS is High, the MDIO read and write operations are disabled and the Hardware Control Interface provides primary configuration control. When MDDIS is Low, the MDIO port is enabled for both read and write operations and the Hardware Control Interface is not used.

##### 3.2.3.1.1 MDIO Addressing

The protocol allows one controller to communicate with multiple LXT971A chips. Pins ADDR<4:0> determine the chip address.

##### 3.2.3.1.2 MDIO Frame Structure

The physical interface consists of a data line (MDIO) and clock line (MDC). The frame structure is shown in [Figures 4 and 5](#) (read and write). MDIO Interface timing is shown in [Table 38](#) on [page 69](#).

**Figure 4. Management Interface Read Frame Structure**

Figure 5. Management Interface Write Frame Structure

### 3.2.3.1.3 MII Interrupts

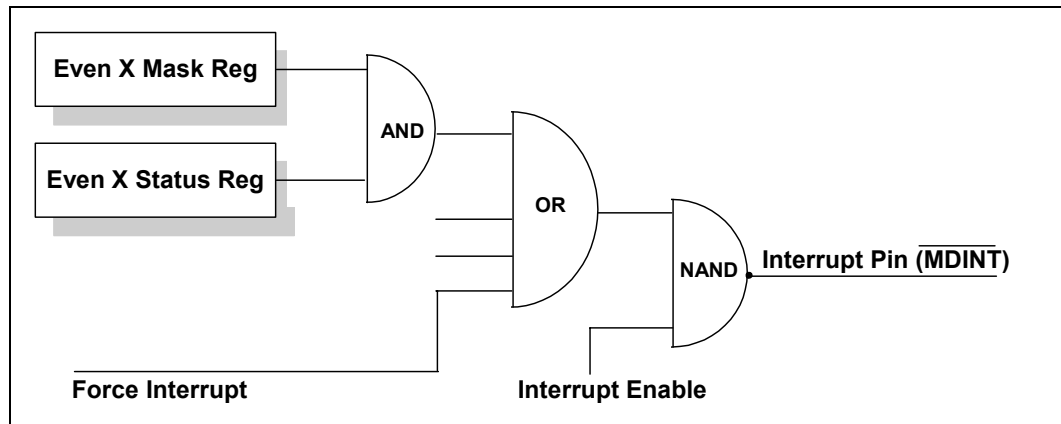

The LXT971A provides a single interrupt pin ( $\overline{\text{MDINT}}$ ). Interrupt logic is shown in Figure 6. The LXT971A also provides two dedicated interrupt registers. Register 18 provides interrupt enable and mask functions and Register 19 provides interrupt status. Setting Register bit 18.1 = 1, enables the device to request interrupt via the  $\overline{\text{MDINT}}$  pin. An active Low on this pin indicates a status change on the LXT971A. Interrupts may be caused by four conditions:

- Auto-negotiation complete
- Speed status change
- Duplex status change
- Link status change

### 3.2.3.2 Hardware Control Interface

The LXT971A provides a Hardware Control Interface for applications where the MDIO is not desired. The Hardware Control Interface uses the three LED driver pins to set device configuration. Refer to the Hardware Configuration Settings section on page 30 for additional details.

Figure 6. Interrupt Logic

## 3.3 Operating Requirements

### 3.3.1 Power Requirements

The LXT971A requires three power supply inputs (VCCD, VCCA, and VCCIO). The digital and analog circuits require 3.3V supplies (VCCD and VCCA). These inputs may be supplied from a single source. Each supply input must be de-coupled to ground.

An additional supply may be used for the MII (VCCIO). The supply may be either +2.5V or +3.3V. Also, the inputs on the MII interface are tolerant to 5V signals from the controller on the other side of the MII interface. Refer to [Table 20 on page 57](#) for MII I/O characteristics.

As a matter of good practice, these supplies should be as clean as possible.

### 3.3.2 Clock Requirements

#### 3.3.2.1 External Crystal/Oscillator

The LXT971A requires a reference clock input that is used to generate transmit signals and recover receive signals. It may be provided by either of two methods: by connecting a crystal across the oscillator pins (XI and XO), or by connecting an external clock source to pin XI. The connection of a clock source to the XI pin requires the XO pin to be left open. A crystal-based clock is recommended over a derived clock (i.e., PLL-based) to minimize transmit jitter. Refer to the LXT971A/972A Design and Layout Guide for a list of recommended clock sources.

A crystal is typically used in NIC applications. An external 25 MHz clock source, rather than a crystal, is frequently used in switch applications. Refer to [Table 21 on page 57](#) for clock timing requirements.

#### 3.3.2.2 MDIO Clock

The MII management channel (MDIO) also requires an external clock. The managed data clock (MDC) speed is a maximum of 8 MHz. Refer to [Table 38 on page 69](#) for details.

## 3.4 Initialization

When the LXT971A is first powered on, reset, or encounters a link failure state, it checks the MDIO register configuration bits to determine the line speed and operating conditions to use for the network link. The configuration bits may be set by the Hardware Control or MDIO interface as shown in [Figure 7](#).

### 3.4.1 MDIO Control Mode

In the MDIO Control mode, the LXT971A reads the Hardware Control Interface pins to set the initial (default) values of the MDIO registers. Once the initial values are set, bit control reverts to the MDIO interface.

### 3.4.2 Hardware Control Mode

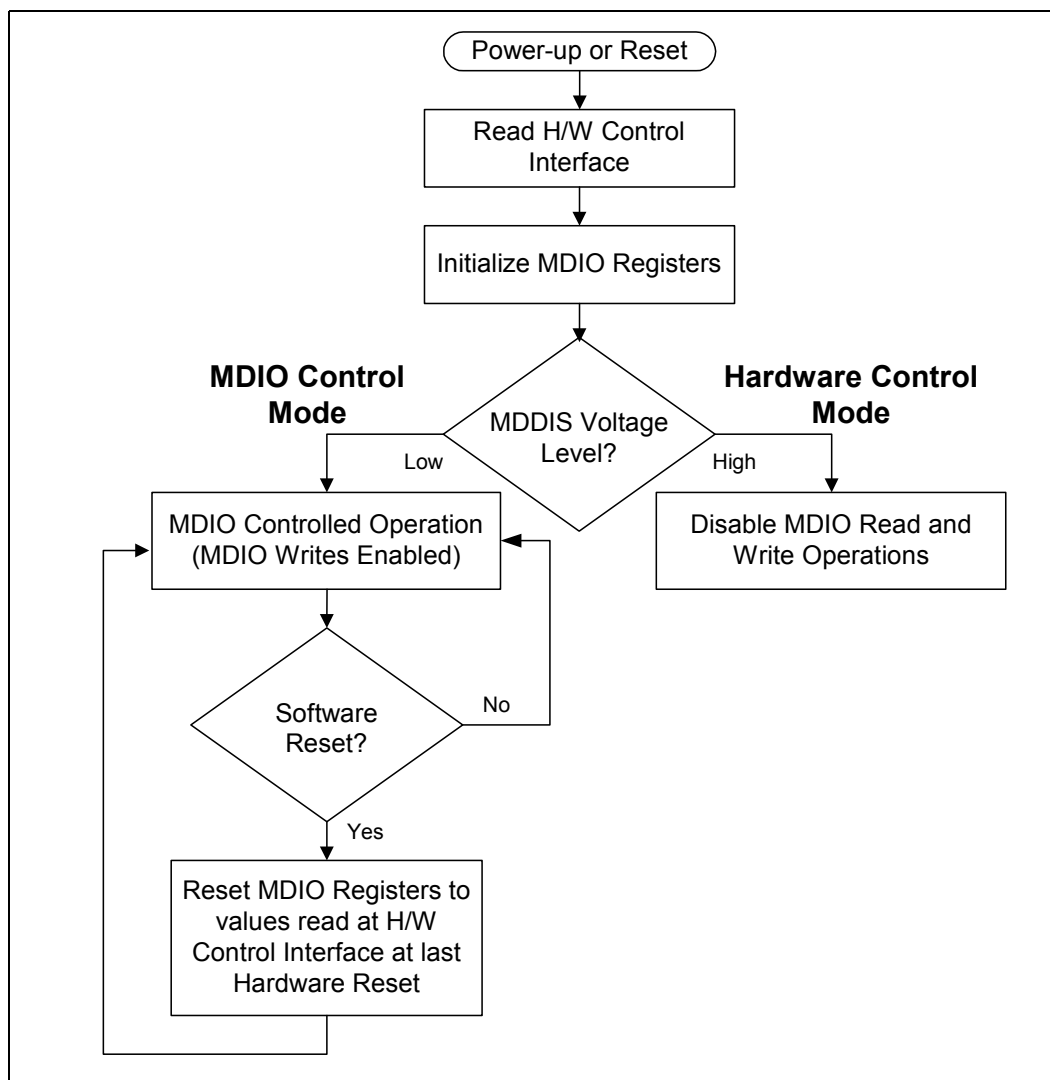

In the Hardware Control Mode, LXT971A disables direct write operations to the MDIO registers via the MDIO Interface. On power-up or hardware reset the LXT971A reads the Hardware Control Interface pins and sets the MDIO registers accordingly.

The following modes are available using either Hardware Control or MDIO Control:

- Force network link to 100FX (Fiber).
- Force network link operation to:
  - 100BASE-TX, Full-Duplex.
  - 100BASE-TX, Half-Duplex.
  - 10BASE-T, Full-Duplex.
  - 10BASE-T, Half-Duplex.
- Allow auto-negotiation/parallel-detection.

When the network link is forced to a specific configuration, the LXT971A immediately begins operating the network interface as commanded. When auto-negotiation is enabled, the LXT971A begins the auto-negotiation/parallel-detection operation.

Figure 7. Initialization Sequence

### 3.4.3 Reduced Power Modes

The LXT971A offers two power-down modes and a sleep mode.

#### 3.4.3.1 Hardware Power Down

The hardware power-down mode is controlled by the PWRDWN pin. When PWRDWN is High, the following conditions are true:

- The LXT971A network port and clock are shut down.
- All outputs are three-stated.
- All weak pad pull-up and pull-down resistors are disabled.
- The MDIO registers are not accessible.

### 3.4.3.2 Software Power Down

Software power-down control is provided by Register bit 0.11 in the Control Register (refer to [Table 43 on page 74](#)). During soft power-down, the following conditions are true:

- The network port is shut down.
- The MDIO registers remain accessible.

### 3.4.3.3 Sleep Mode

The LXT971A supports a power-saving sleep mode. Sleep mode is enabled when SLEEP is asserted via pin 32(LQFP)/H7(PBGA). The value of pin 32/H7 can be overridden by Register bit 16.6 when in managed mode as shown in [Table 4 on page 18](#). The LXT971A enters into sleep mode when SLEEP is enabled and no energy is detected on the twisted-pair input for 1-3 seconds (the time is controlled by Register bits 16.4:3 in the Configuration Register, with a default of 3.04 seconds).

During this mode, the LXT971A still responds to management transactions (MDC/MDIO). In this mode the power consumption is minimized, and the supply current is reduced below the maximum value given in [Table 18 on page 56](#). If the LXT971A detects activity on the twisted-pair inputs, it comes out of the sleep state and check for link. If no link is detected in 1-3 seconds (programmable) it reverts back to the low power sleep state.

**Note:** Sleep Mode is not functional in fiber network applications.

### 3.4.4 Reset

The LXT971A provides both hardware and software resets. Configuration control of auto-negotiation, speed, and duplex mode selection is handled differently for each. During a hardware reset, auto-negotiation and speed configuration settings are read in from pins (refer to [Table 9 on page 30](#) for pin settings and to [Table 43 on page 74](#) for register bit definitions).

During a software reset (0.15 = 1), these bit settings are not re-read from the pins. They revert back to the values that were read in during the last hardware reset. Therefore, any changes to pin values made since the last hardware reset is not detected during a software reset.

During a hardware reset, register information is unavailable for 1 ms after de-assertion of the reset. During a software reset (0.15 = 1) the registers are available for reading. The reset bit should be polled to see when the part has completed reset (0.15 = 0).

### 3.4.5 Hardware Configuration Settings

The LXT971A provides a hardware option to set the initial device configuration. The hardware option uses the three LED driver pins. This provides three control bits, as listed in Table 9. The LED drivers can operate as either open-drain or open-source circuits as shown in Figure 8.

Figure 8. Hardware Configuration Settings

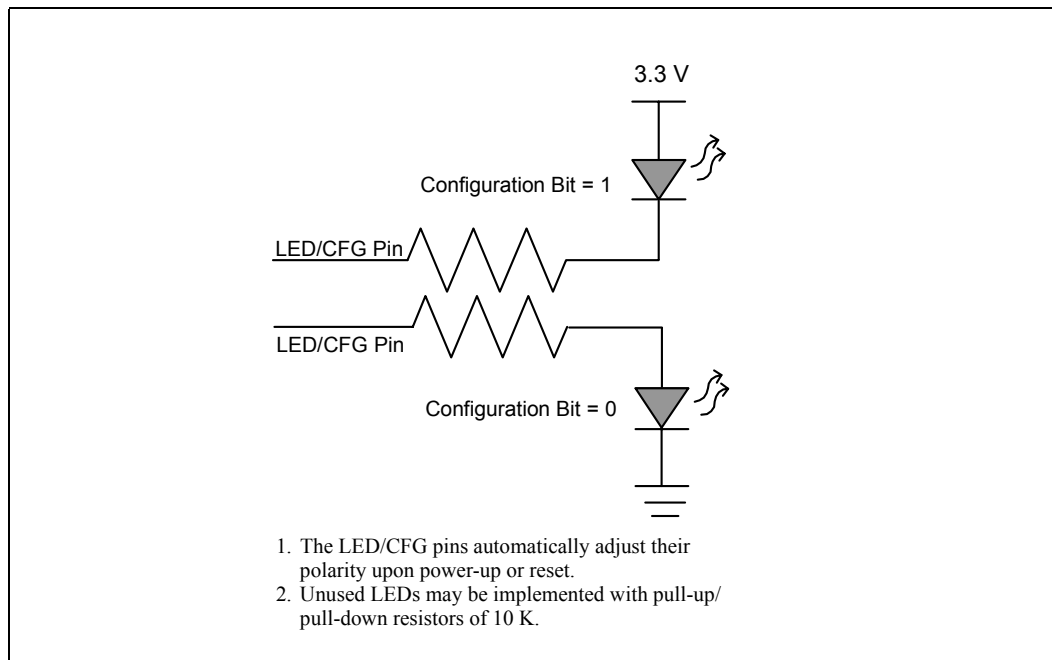

Table 9. Hardware Configuration Settings

Desired Mode			LED/CFG <sub>n</sub> Pin Settings <sup>1</sup>			Resulting Register Bit Values						
						Control Register			AN Advertisement Registers			
Auto-Neg	Speed (Mbps)	Duplex	1	2	3	Auto-Neg 0.12	Speed 0.13	FD 0.8	100FD 4.8	100TX 4.7	10FD 4.6	10T 4.5
Disabled	10	Half	Low	Low	Low	0	0	0	N/A Auto-Negotiation Advertisement			
		Full	Low	Low	High			1				
	100	Half	Low	High	Low		1	0				
		Full	Low	High	High			1				
Enabled	100 Only	Half	High	Low	Low	1	1	0	0	1	0	0
		Full	High	Low	High			1	1	1	0	0
	10/100	Half Only	High	High	Low			0	0	1	0	1
		Full or Half	High	High	High			1	1	1	1	1

1. Refer to Table 7 on page 19 for LED/CFG pin assignments.

## 3.5 Establishing Link

See [Figure 9](#) for an overview of link establishment.

### 3.5.1 Auto-Negotiation

If not configured for forced operation, the LXT971A attempts to auto-negotiate with its link partner by sending Fast Link Pulse (FLP) bursts. Each burst consists of up to 33 link pulses spaced 62.5  $\mu$ s apart. Odd link pulses (clock pulses) are always present. Even link pulses (data pulses) may be present or absent to indicate a “1” or a “0”. Each FLP burst exchanges 16 bits of data, which are referred to as a “link code word”. All devices that support auto-negotiation must implement the “Base Page” defined by IEEE 802.3 (registers 4 and 5). LXT971A also supports the optional “Next Page” function as described in [Tables 50 and 51 on page 80](#) (registers 7 and 8).

#### 3.5.1.1 Base Page Exchange

By exchanging Base Pages, the LXT971A and its link partner communicate their capabilities to each other. Both sides must receive at least three identical base pages for negotiation to continue. Each side identifies the highest common capabilities that both sides support and configures itself accordingly.

#### 3.5.1.2 Next Page Exchange

Additional information, above that required by base page exchange is also sent via “Next Pages”. The LXT971A fully supports the IEEE 802.3ab method of negotiation via Next Page exchange.

#### 3.5.1.3 Controlling Auto-Negotiation

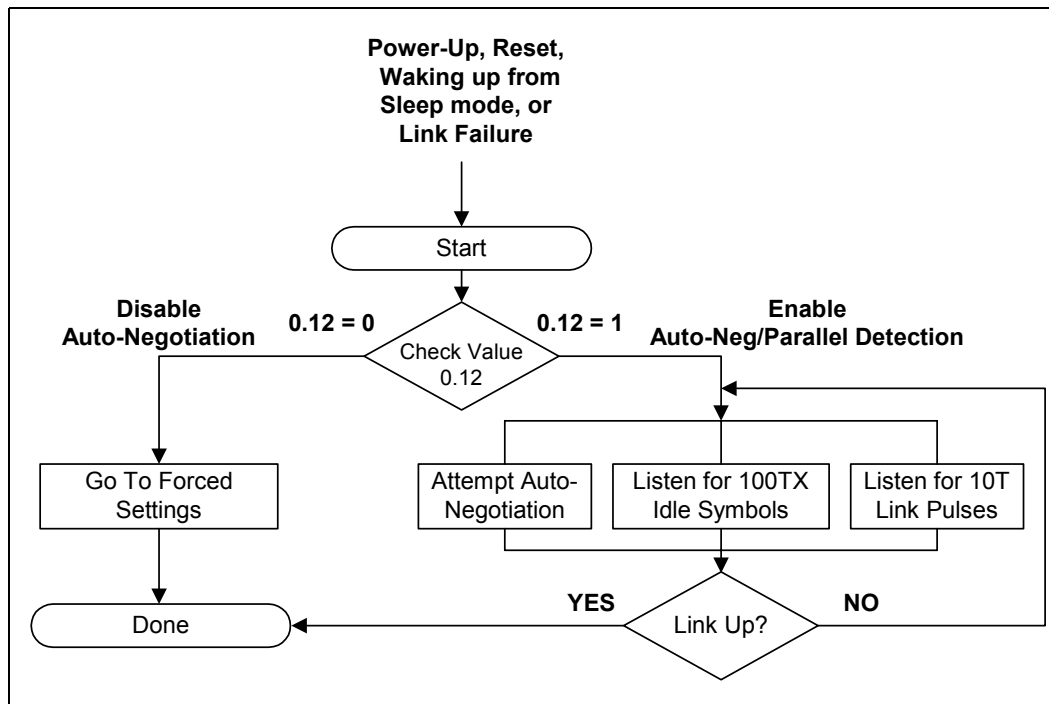

When auto-negotiation is controlled by software, the following steps are recommended:

- After power-up, power-down, or reset, the power-down recovery time, as specified in [Table 40 on page 70](#), must be exhausted before proceeding.
- Set the Auto-Negotiation Advertisement Register bits.
- Enable auto-negotiation (set MDIO Register bit 0.12 = 1).

### 3.5.2 Parallel Detection

For the parallel detection feature of auto-negotiation, the LXT971A also monitors for 10BASE-T Normal Link Pulses (NLP) and 100BASE-TX Idle symbols. If either is detected, the device automatically reverts to the corresponding operating mode. Parallel detection allows the LXT971A to communicate with devices that do not support auto-negotiation.

Figure 9. Link Establishment Overview

## 3.6 MII Operation

The LXT971A device implements the Media Independent Interface (MII) as defined in the IEEE 802.3 standard. Separate channels are provided for transmitting data from the MAC to the LXT971A (TXD), and for passing data received from the line (RXD) to the MAC. Each channel has its own clock, data bus, and control signals. Nine signals are used to pass received data to the MAC: RXD<3:0>, RX\_CLK, RX\_DV, RX\_ER, COL, and CRS. Seven signals are used to transmit data from the MAC: TXD<3:0>, TX\_CLK, TX\_EN, and TX\_ER.

The LXT971A supplies both clock signals as well as separate outputs for carrier sense and collision. Data transmission across the MII is normally implemented in 4-bit-wide nibbles.

### 3.6.1 MII Clocks

The LXT971A is the master clock source for data transmission and supplies both MII clocks (RX\_CLK and TX\_CLK). It automatically sets the clock speeds to match link conditions. When the link is operating at 100 Mbps, the clocks are set to 25 MHz. When the link is operating at 10 Mbps, the clocks are set to 2.5 MHz. Figures 10 through 12 show the clock cycles for each mode. The transmit data and control signals must always be synchronized to TX\_CLK by the MAC. The LXT971A samples these signals on the rising edge of TX\_CLK.

### 3.6.2 Transmit Enable

The MAC must assert TX\_EN the same time as the first nibble of preamble, and de-assert TX\_EN after the last bit of the packet.

### 3.6.3 Receive Data Valid

The LXT971A asserts RX\_DV when it receives a valid packet. Timing changes depend on line operating speed:

- For 100BASE-TX links, RX\_DV is asserted from the first nibble of preamble to the last nibble of the data packet.
- For 10BT links, the entire preamble is truncated. RX\_DV is asserted with the first nibble of the Start of Frame Delimiter (SFD) “5D” and remains asserted until the end of the packet.

### 3.6.4 Carrier Sense

Carrier Sense (CRS) is an asynchronous output. It is always generated when a packet is received from the line and in half-duplex mode when a packet is transmitted. [Table 10](#) summarizes the conditions for assertion of carrier sense, collision, and data loopback signals.

Carrier sense is not generated when a packet is transmitted and in full-duplex mode.

### 3.6.5 Error Signals

When LXT971A is in 100 Mbps mode and receives an invalid symbol from the network, it asserts RX\_ER and drives “1110” on the RXD pins.

When the MAC asserts TX\_ER, the LXT971A drives “H” symbols out on the TPFOP/N pins.

### 3.6.6 Collision

The LXT971A asserts its collision signal, asynchronously to any clock, whenever the line state is half-duplex and the transmitter and receiver are active at the same time. [Table 10](#) summarizes the conditions for assertion of carrier sense, collision, and data loopback signals.

Figure 10. 10BASE-T Clocking

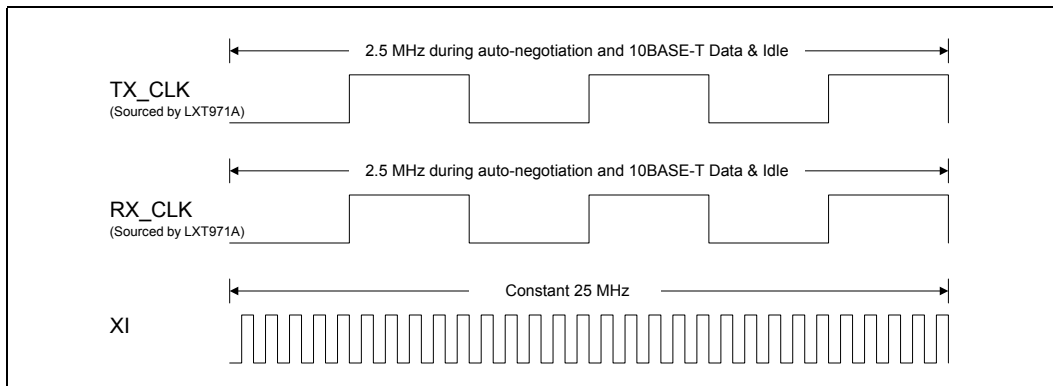

Figure 11. 100BASE-X Clocking

Figure 12. Link Down Clock Transition

### 3.6.7 Loopback

The LXT971A provides two loopback functions, operational and test (see Table 10). Loopback paths are shown in Figure 13.

### 3.6.7.1 Operational Loopback

Operational loopback is provided for 10 Mbps half-duplex links when Register bit 16.8 = 0. Data transmitted by the MAC (TXData) is looped back on the receive side of the MII (RXData). Operational loopback is not provided for 100 Mbps links, full-duplex links, or when 16.8 = 1.

### 3.6.7.2 Test Loopback

A test loopback function is provided for diagnostic testing of the LXT971A. During test loopback, twisted-pair and fiber interfaces are disabled. Data transmitted by the MAC is internally looped back by the LXT971A and returned to the MAC.

Test loopback is available for both 100BASE-TX and 10BASE-T operation, and is enabled by setting the following register bits:

- Register bit 0.14 = 1
- Register bit 0.8 = 1 (full-duplex)
- Register bit 0.12 = 0 (disable auto-negotiation).

Test loopback is also available for 100BASE-FX operation. Test loopback in this mode is enabled by setting Register bit 0.14 = 1 and tying the SD input to an LVPECL logic High value (2.4 V).

Figure 13. Loopback Paths

**Table 10. Carrier Sense, Loopback, and Collision Conditions**

Speed	Duplex Condition	Carrier Sense	Test <sup>1</sup> Loopback	Operational Loopback	Collision
100 Mbps	Full-Duplex	Receive Only	Yes	No	None
	Half-Duplex	Transmit or Receive	No	No	Transmit and Receive
10 Mbps	Full-Duplex	Receive Only	Yes	No	None
	Half-Duplex, Register bit 16.8 = 0	Transmit or Receive	Yes	Yes	Transmit and Receive
	Half-Duplex, Register bit 16.8 = 1	Transmit or Receive	No	No	Transmit and Receive

1. Test Loopback is enabled when 0.14 = 1

### 3.7 100 Mbps Operation

#### 3.7.1 100BASE-X Network Operations

During 100BASE-X operation, the LXT971A transmits and receives 5-bit symbols across the network link. Figure 14 shows the structure of a standard frame packet. When the MAC is not actively transmitting data, the LXT971A sends out Idle symbols on the line.

In 100BASE-TX mode, the LXT971A scrambles and transmits the data to the network using MLT-3 line code (Figure 15 on page 37). MLT-3 signals received from the network are de-scrambled, decoded, and sent across the MII to the MAC.

In 100BASE-FX mode, the LXT971A transmits and receives NRZI signals across the LVPECL interface. An external 100FX transceiver module is required to complete the fiber connection. To enable 100BASE-FX operation, auto-negotiation must be disabled and FX selected.

**Figure 14. 100BASE-X Frame Format**

Figure 15. 100BASE-TX Data Path

As shown in [Figure 14 on page 36](#), the MAC starts each transmission with a preamble pattern. As soon as the LXT971A detects the start of preamble, it transmits a Start-of-Stream Delimiter (SSD, symbols J and K) to the network. It then encodes and transmits the rest of the packet, including the balance of the preamble, the SFD, packet data, and CRC.

Once the packet ends, the LXT971A transmits the End-of-Stream Delimiter (ESD, symbols T and R) and then returns to transmitting Idle symbols. 4B/5B coding is shown in [Table 11 on page 40](#).

[Figure 16](#) shows normal reception with no errors. When the LXT971A receives invalid symbols from the line, it asserts RX\_ER as shown in [Figure 17](#).

Figure 16. 100BASE-TX Reception with No Errors

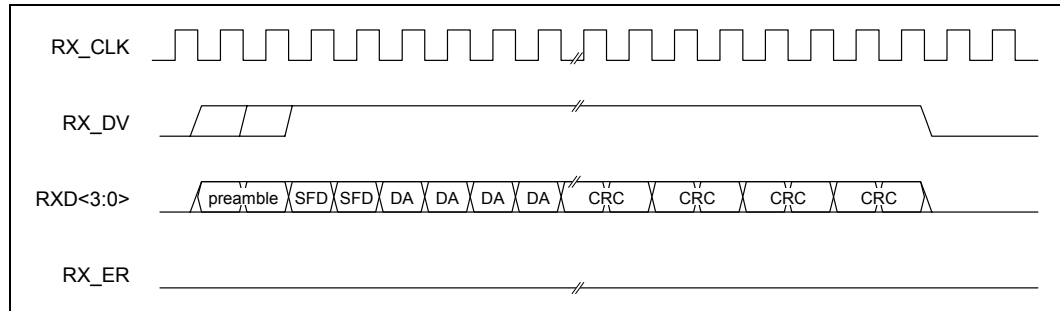

Figure 17. 100BASE-TX Reception with Invalid Symbol

### 3.7.2 Collision Indication

Figure 18 shows normal transmission. Upon detection of a collision, the COL output is asserted and remains asserted for the duration of the collision as shown in Figure 19.

Figure 18. 100BASE-TX Transmission with No Errors

Figure 19. 100BASE-TX Transmission with Collision

### 3.7.3 100BASE-X Protocol Sublayer Operations

With respect to the 7-layer communications model, the LXT971A is a Physical Layer 1 (PHY) device. The LXT971A implements the Physical Coding Sublayer (PCS), Physical Medium Attachment (PMA), and Physical Medium Dependent (PMD) sublayers of the reference model defined by the IEEE 802.3u standard. The following paragraphs discuss LXT971A operation from the reference model point of view.

#### 3.7.3.1 PCS Sublayer

The Physical Coding Sublayer (PCS) provides the MII interface, as well as the 4B/5B encoding/decoding function.

For 100BASE-TX and 100FX operation, the PCS layer provides IDLE symbols to the PMD-layer line driver as long as TX\_EN is de-asserted.

##### 3.7.3.1.1 Preamble Handling

When the MAC asserts TX\_EN, the PCS substitutes a /J/K symbol pair, also known as the Start-of-Stream Delimiter (SSD), for the first two nibbles received across the MII. The PCS layer continues to encode the remaining MII data, following the coding in Table 11, until TX\_EN is de-asserted. It then returns to supplying IDLE symbols to the line driver.

In the receive direction, the PCS layer performs the opposite function, substituting two preamble nibbles for the SSD.

### 3.7.3.1.2 Dribble Bits

The LXT971A handles dribbles bits in all modes. If one to four dribble bits are received, the nibble is passed across the MII, and padded with ones if necessary. If five to seven dribble bits are received, the second nibble is not sent to the MII bus.

Figure 20. Protocol Sublayers

Table 11. 4B/5B Coding

Code Type	4B Code 3 2 1 0	Name	5B Code 4 3 2 1 0	Interpretation
DATA	0 0 0 0	0	1 1 1 1 0	Data 0
	0 0 0 1	1	0 1 0 0 1	Data 1
	0 0 1 0	2	1 0 1 0 0	Data 2
	0 0 1 1	3	1 0 1 0 1	Data 3
	0 1 0 0	4	0 1 0 1 0	Data 4
	0 1 0 1	5	0 1 0 1 1	Data 5
	0 1 1 0	6	0 1 1 1 0	Data 6
	0 1 1 1	7	0 1 1 1 1	Data 7
	1 0 0 0	8	1 0 0 1 0	Data 8
	1 0 0 1	9	1 0 0 1 1	Data 9
	1 0 1 0	A	1 0 1 1 0	Data A
	1 0 1 1	B	1 0 1 1 1	Data B
	1 1 0 0	C	1 1 0 1 0	Data C
	1 1 0 1	D	1 1 0 1 1	Data D
	1 1 1 0	E	1 1 1 0 0	Data E
	1 1 1 1	F	1 1 1 0 1	Data F
IDLE	undefined	I <sup>1</sup>	1 1 1 1 1	Used as inter-stream fill code
CONTROL	0 1 0 1	J <sup>2</sup>	1 1 0 0 0	Start-of-Stream Delimiter (SSD), part 1 of 2
	0 1 0 1	K <sup>2</sup>	1 0 0 0 1	Start-of-Stream Delimiter (SSD), part 2 of 2
	undefined	T <sup>3</sup>	0 1 1 0 1	End-of-Stream Delimiter (ESD), part 1 of 2
	undefined	R <sup>3</sup>	0 0 1 1 1	End-of-Stream Delimiter (ESD), part 2 of 2
1. The /I/ (Idle) code group is sent continuously between frames. 2. The /J/ and /K/ (SSD) code groups are always sent in pairs; /K/ follows /J/. 3. The /T/ and /R/ (ESD) code groups are always sent in pairs; /R/ follows /T/. 4. An /H/ (Error) code group is used to signal an error condition.				

**Table 11. 4B/5B Coding (Continued)**

Code Type	4B Code 3 2 1 0	Name	5B Code 4 3 2 1 0	Interpretation
INVALID	undefined	H <sup>4</sup>	0 0 1 0 0	Transmit Error. Used to force signaling errors
	undefined	Invalid	0 0 0 0 0	Invalid
	undefined	Invalid	0 0 0 0 1	Invalid
	undefined	Invalid	0 0 0 1 0	Invalid
	undefined	Invalid	0 0 0 1 1	Invalid
	undefined	Invalid	0 0 1 0 1	Invalid
	undefined	Invalid	0 0 1 1 0	Invalid
	undefined	Invalid	0 1 0 0 0	Invalid
	undefined	Invalid	0 1 1 0 0	Invalid
	undefined	Invalid	1 0 0 0 0	Invalid
	undefined	Invalid	1 1 0 0 1	Invalid

1. The // (Idle) code group is sent continuously between frames.  
 2. The /J/ and /K/ (SSD) code groups are always sent in pairs; /K/ follows /J/.  
 3. The /T/ and /R/ (ESD) code groups are always sent in pairs; /R/ follows /T/.  
 4. An /H/ (Error) code group is used to signal an error condition.

### 3.7.3.2 PMA Sublayer

#### 3.7.3.2.1 Link

In 100 Mbps mode, the LXT971A establishes a link whenever the scrambler becomes locked and remains locked for approximately 50 ms. Whenever the scrambler loses lock (receiving less than 12 consecutive idle symbols during a 2 ms window), the link is taken down. This provides a very robust link, essentially filtering out any small noise hits that may otherwise disrupt the link. Furthermore, 100 Mbps idle patterns will not bring up a 10 Mbps link.

The LXT971A reports link failure via the MII status bits (Register bits 1.2 and 17.10) and interrupt functions. Link failure causes the LXT971A to re-negotiate if auto-negotiation is enabled.

#### 3.7.3.2.2 Link Failure Override

The LXT971A normally transmits data packets only if it detects the link is up. Setting Register bit 16.14 = 1 overrides this function, allowing the LXT971A to transmit data packets even when the link is down. This feature is provided as a diagnostic tool. Note that auto-negotiation must be disabled to transmit data packets in the absence of link. If auto-negotiation is enabled, the LXT971A automatically transmits FLP bursts if the link is down.

#### 3.7.3.2.3 Carrier Sense

For 100BASE-TX and 100FX links, a start-of-stream delimiter (SSD) or /J/K symbol pair causes assertion of carrier sense (CRS). An end-of-stream delimiter (ESD) or /T/R symbol pair causes de-assertion of CRS. The PMA layer also de-asserts CRS if IDLE symbols are received without /T/R; however, in this case RX\_ER is asserted for one clock cycle when CRS is de-asserted.

Usage of CRS for Interframe Gap (IFG) timing is *not* recommended for the following reasons:

- De-assertion time for CRS is slightly longer than assertion time. This causes IFG intervals to appear somewhat shorter to the MAC than it actually is on the wire.
- CRS de-assertion is not aligned with TX\_EN de-assertion on transmit loopbacks in half-duplex mode.

#### 3.7.3.2.4 Receive Data Valid

The LXT971A asserts RX\_DV to indicate that the received data maps to valid symbols. However, RXD outputs zeros until the received data is decoded and available for transfer to the controller.

### 3.7.3.3 Twisted-Pair PMD Sublayer

The twisted-pair Physical Medium Dependent (PMD) layer provides the signal scrambling and de-scrambling, line coding and decoding (MLT-3 for 100BASE-TX, Manchester for 10BASE-T), as well as receiving, polarity correction, and baseline wander correction functions.

#### Scrambler/De-scrambler

The purpose of the scrambler is to spread the signal power spectrum and further reduce EMI using an 11-bit, data-independent polynomial. The receiver automatically decodes the polynomial whenever IDLE symbols are received.

#### Scrambler Seeding

Once the transmit data (or Idle symbols) are properly encoded, they are scrambled to further reduce EMI and to spread the power spectrum using an 11-bit scrambler seed. Five seed bits are determined by the PHY address, and the remaining bits are hard coded in the design.

#### Scrambler Bypass

The scrambler/de-scrambler can be bypassed by setting Register bit 16.12 = 1. The scrambler is automatically bypassed when the fiber port is enabled. Scrambler bypass is provided for diagnostic and test support.

#### 3.7.3.3.1 Baseline Wander Correction

The LXT971A provides a baseline wander correction function which makes the device robust under all network operating conditions. The MLT3 coding scheme used in 100BASE-TX is by definition “unbalanced”. This means that the average value of the signal voltage can “wander” significantly over short time intervals (tenths of seconds). This wander can cause receiver errors at long-line lengths (100 meters) in less robust designs. Exact characteristics of the wander are completely data dependent.

The LXT971A baseline wander correction characteristics allow the device to recover error-free data while receiving worst-case “killer” packets over all cable lengths.

#### 3.7.3.3.2 Polarity Correction

The 100BASE-TX de-scrambler automatically detects and corrects for the condition where the receive signal at TPFIP and TPFIN is inverted.

### 3.7.3.3.3 Programmable Slew Rate Control

The LXT971A device supports a slew rate mechanism whereby one of four pre-selected slew rates can be used. This allows the designer to optimize the output waveform to match the characteristics of the magnetics. The slew rate is determined by the TxSLEW pins as shown in [Table 4 on page 18](#).

### 3.7.3.4 Fiber PMD Sublayer

The LXT971A provides a Low Voltage PECL interface for connection to an external 3.3 V or 5.0 V fiber-optic transceiver. (The external transceiver provides the PMD function for fiber media.) The LXT971A uses an NRZI format for the fiber interface. The fiber interface operates at 100 Mbps and does not support 10FL applications.

## 3.8 10 Mbps Operation

The LXT971A operates as a standard 10BASE-T transceiver. The LXT971A supports all the standard 10 Mbps functions. During 10BASE-T operation, the LXT971A transmits and receives Manchester-encoded data across the network link. When the MAC is not actively transmitting data, the LXT971A drives link pulses onto the line.

In 10BASE-T mode, the polynomial scrambler/de-scrambler is inactive. Manchester-encoded signals received from the network are decoded by the LXT971A and sent across the MII to the MAC.

The LXT971A does not support fiber connections at 10 Mbps.

### 3.8.1 10BASE-T Preamble Handling

The LXT971A offers two options for preamble handling, selected by Register bit 16.5. In 10BASE-T Mode when 16.5 = 0, the LXT971A strips the entire preamble off of received packets. CRS is asserted coincident with SFD. RX\_DV is held Low for the duration of the preamble. When RX\_DV is asserted, the very first two nibbles driven by the LXT971A are the SFD "5D" hex followed by the body of the packet.

In 10BASE-T mode with 16.5 = 1, the LXT971A passes the preamble through the MII and asserts RX\_DV and CRS simultaneously. In 10BASE-T loopback, the LXT971A loops back whatever the MAC transmits to it, including the preamble.

### 3.8.2 10BASE-T Carrier Sense

For 10BASE-T links, CRS assertion is based on reception of valid preamble, and de-assertion on reception of an end-of-frame (EOF) marker. Register bit 16.7 allows CRS de-assertion to be synchronized with RX\_DV de-assertion. Refer to [Table 52 on page 81](#).

### 3.8.3 10BASE-T Dribble Bits

The LXT971A device handles dribbles bits in all modes. If one to four dribble bits are received, the nibble is passed across the MII, padded with ones if necessary. If five to seven dribble bits are received, the second nibble is not sent to the MII bus.

### 3.8.4 10BASE-T Link Integrity Test

In 10BASE-T mode, the LXT971A always transmits link pulses. When the Link Integrity Test function is enabled (the normal configuration), it monitors the connection for link pulses. Once link pulses are detected, data transmission is enabled and remains enabled as long as either the link pulses or data transmission continue. If the link pulses stop, the data transmission is disabled.

If the Link Integrity Test function is disabled, the LXT971A transmits to the connection regardless of detected link pulses. The Link Integrity Test function can be disabled by setting Register bit 16.14 = 1.

#### 3.8.4.1 Link Failure

Link failure occurs if the Link Integrity Test is enabled and link pulses or packets stop being received. If this condition occurs, the LXT971A returns to the auto-negotiation phase if auto-negotiation is enabled. If the Link Integrity Test function is disabled by setting Register bit 16.14 = 1 in the Configuration Register, the LXT971A transmits packets, regardless of link status.

### 3.8.5 10BASE-T SQE (Heartbeat)

By default, the Signal Quality Error (SQE) or heartbeat function is disabled on the LXT971A. To enable this function, set Register bit 16.9 = 1. When this function is enabled, the LXT971A asserts its COL output for 5-15 BT after each packet. See [Figure 35 on page 67](#) for SQE timing parameters.

### 3.8.6 10BASE-T Jabber

If a transmission exceeds the jabber timer, the LXT971A disables the transmit and loopback functions. See [Figure 34 on page 67](#) for jabber timing parameters.

The LXT971A automatically exits jabber mode after the unjabber time has expired. This function can be disabled by setting Register bit 16.10 = 1.

### 3.8.7 10BASE-T Polarity Correction

The LXT971A automatically detects and corrects for the condition where the receive signal (TPFIP/N) is inverted. Reversed polarity is detected if eight inverted link pulses, or four inverted end-of-frame (EOF) markers, are received consecutively. If link pulses or data are not received by the maximum receive time-out period (96-128 ms), the polarity state is reset to a non-inverted state.

## 3.9 Monitoring Operations

### 3.9.1 Monitoring Auto-Negotiation

Auto-negotiation can be monitored as follows:

- Register bit 17.7 is set to 1 once the auto-negotiation process is completed.
- Register bits 1.2 and 17.10 are set to 1 once the link is established.

- Register bits 17.14 and 17.9 can be used to determine the link operating conditions (speed and duplex).

### 3.9.1.1 Monitoring Next Page Exchange

The LXT971A offers an Alternate Next Page mode to simplify the next page exchange process. Normally, Register bit 6.1 (Page Received) remains set until read. When Alternate Next Page mode is enabled Register bit 6.1 is automatically cleared whenever a new negotiation process takes place. This prevents the user from reading an old value in 6.1 and assuming that Registers 5 and 8 (Partner Ability) contain valid information. Additionally, the LXT971A uses Register bit 6.5 to indicate when the current received page is the base page. This information is useful for recognizing when next pages must be resent due to a new negotiation process starting. Register bits 6.1 and 6.5 are cleared when read.

## 3.9.2 LED Functions

The LXT971A incorporates three direct LED drivers. On power up all the drivers are asserted for approximately 1 second after reset de-asserts. Each LED driver can be programmed using the LED Configuration Register (refer to [Table 56 on page 85](#)) to indicate one of the following conditions:

- Operating Speed
- Transmit Activity
- Receive Activity
- Collision Condition
- Link Status
- Duplex Mode

The LED drivers can also be programmed to display various combined status conditions. For example, setting Register bits 20.15:12 = 1101 produces the following combination of Link and Activity indications:

- If Link is down LED is off.
- If Link is up LED is on.
- If Link is up and activity is detected, the LED blinks at the stretch interval selected by Register bits 20.3:2 and continues to blink as long as activity is present.

The LED driver pins also provide initial configuration settings. The LED pins are sensitive to polarity and automatically pull up or pull down to configure for either open drain or open collector circuits (10 mA Max current rating) as required by the hardware configuration. Refer to the discussion of “[Hardware Configuration Settings](#)” on [page 30](#) for details.

### 3.9.2.1 LED Pulse Stretching

The LED Configuration Register also provides optional LED pulse stretching to 30, 60, or 100 ms. The pulse stretch time is further extended if the event occurs again during this pulse stretch period.

When an event such as receiving a packet occurs it is edge detected and it starts the stretch timer. The LED driver remains asserted until the stretch timer expires. If another event occurs before the stretch timer expires then the stretch timer is reset and the stretch time is extended.

When a long event (such as duplex status) occurs it is edge detected and it starts the stretch timer. When the stretch timer expires the edge detector is reset so that a long event causes another pulse to be generated from the edge detector which resets the stretch timer and causes the LED driver to remain asserted. Figure 21 shows how the stretch operation functions.

**Figure 21. LED Pulse Stretching**

## 3.10 Boundary Scan (JTAG1149.1) Functions

LXT971A includes a IEEE 1149.1 boundary scan test port for board level testing. All digital input, output, and input/output pins are accessible. The BSDL file is available by contacting your local sales office or by accessing the Intel website ([www.intel.com](http://www.intel.com)).

### 3.10.1 Boundary Scan Interface

This interface consists of five pins (TMS, TDI, TDO,  $\overline{\text{TRST}}$ , and TCK). It includes a state machine, data register array, and instruction register. The TMS and TDI pins are internally pulled up. TCK is internally pulled down. TDO does not have an internal pull-up or pull-down.

### 3.10.2 State Machine

The TAP controller is a 16 state machine driven by the TCK and TMS pins. Upon reset the TEST\_LOGIC\_RESET state is entered. The state machine is also reset when TMS and TDI are high for five TCK periods.

### 3.10.3 Instruction Register

After the state machine resets, the IDCODE instruction is always invoked. The decode logic ensures the correct data flow to the Data registers according to the current instruction. Valid instructions are listed in Table 13.

### 3.10.4 Boundary Scan Register (BSR)

Each Boundary Scan Register (BSR) cell has two stages. A flip-flop and a latch are used for the serial shift stage and the parallel output stage. There are four modes of operation as listed in Table 12.

**Table 12. BSR Mode of Operation**

Mode	Description
1	Capture
2	Shift
3	Update
4	System Function

**Table 13. Supported JTAG Instructions**

Name	Code	Description	Mode	Data Register
EXTEST	1111 1111 1110 1000	External Test	Test	BSR
IDCODE	1111 1111 1111 1110	ID Code Inspection	Normal	ID REG
SAMPLE	1111 1111 1111 1000	Sample Boundary	Normal	BSR
HIGHZ	1111 1111 1100 1111	Force Float	Normal	Bypass
CLAMP	1111 1111 1110 1111	Control Boundary to 1/0	Test	Bypass
BYPASS	1111 1111 1111 1111	Bypass Scan	Normal	Bypass

**Table 14. Device ID Register**

31:28	27:12	11:8	7:1	0
Version <sup>2</sup>	Part ID (hex)	Jedec Continuation Characters	JEDEC ID <sup>1</sup>	Reserved
XXXX	03CB	0000	111 1110	1
<p>1. The JEDEC IS is an 8-bit identifier. The MSB is for parity and is ignored. Intel's JEDEC ID is FE (1111 1110), which becomes 111 1110.</p> <p>2. See the LXT971A/972A Specification Update (document number 249354) for the current version of the Jedec continuation characters.</p>				

## 4.0 Application Information

### 4.1 Magnetics Information

The LXT971A requires a 1:1 ratio for both the receive and transmit transformers. The transformer isolation voltage should be rated at 2 kV to protect the circuitry from static voltages across the connectors and cables. Refer to [Table 15](#) for transformer requirements.

A cross-reference list of magnetic manufacturers and part numbers is available in Magnetic Manufacturers for Networking Product Applications (document number 248991) and is found on the Intel web site ([www.Intel.com](http://www.Intel.com)). Before committing to a specific component, contact the manufacturer for current product specifications and validate the magnetics for the specific application.

**Table 15. Magnetics Requirements**

Parameter	Min	Nom	Max	Units	Test Condition
Rx turns ratio	–	1 : 1	–	–	–
Tx turns ratio	–	1 : 1	–	–	–
Insertion loss	0.0	0.6	1.1	dB	–
Primary inductance	350	–	–	μH	–
Transformer isolation	–	1.5	–	kV	–
Differential to common mode rejection	40	–	–	dB	.1 to 60 MHz
	35	–	–	dB	60 to 100 MHz
Return Loss	-16	–	–	dB	30 MHz
	-10	–	–	dB	80 MHz

### 4.2 Typical Twisted-Pair Interface

[Table 16](#) provides a comparison of the RJ-45 connections for NIC and Switch applications in a typical twisted-pair interface setting.

**Table 16. I/O Pin Comparison of NIC and Switch RJ-45 Setups**

Symbol	RJ-45	
	Switch	NIC
TPIP	1	3
TPIN	2	6
TPOP	3	1
TPON	6	2

[Figure 22 on page 49](#) shows a typical twisted-pair interface with the RJ-45 connections crossed over for a Switch configuration. [Figure 23 on page 50](#) provides a typical twisted-pair interface with the RJ-45 connections configured for a NIC application.

Figure 22. Typical Twisted-Pair Interface - Switch

Figure 23. Typical Twisted-Pair Interface - NIC

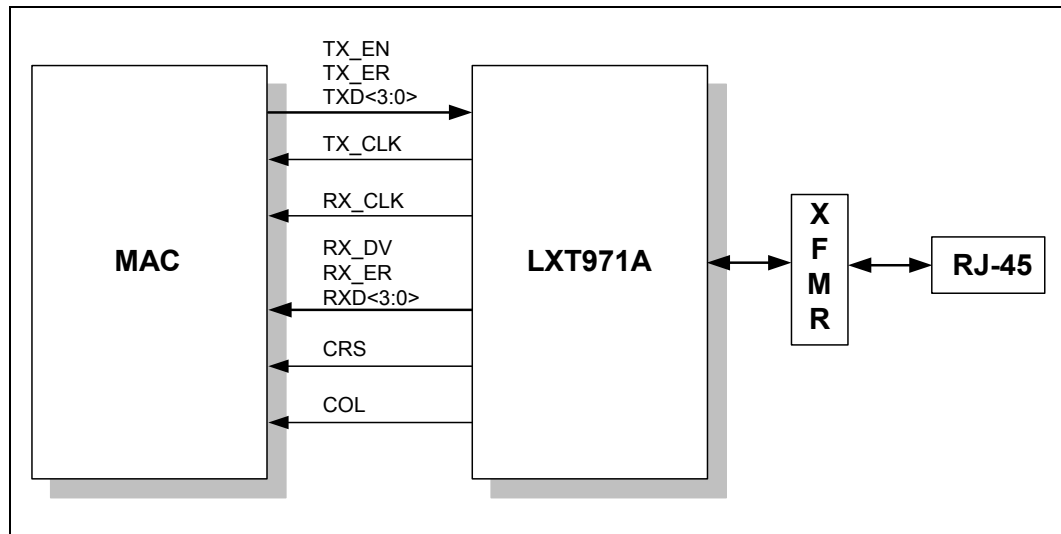

Figure 24. Typical MII Interface

## 4.3 The Fiber Interface

The fiber interface consists of an LVPECL transmit and receive pair to an external fiber-optic transceiver. Both 3.3 V fiber-optic transceivers and 5 V fiber-optic transceivers can be used with the LXT971A.

The following should occur in 3.3 V fiber transceiver applications as shown in [Figure 25](#):

- The transmit pair should be DC-coupled with the 50  $\Omega$ /16  $\Omega$  pull-up combination
- The receive pair should be DC-coupled with an emitter current path for the fiber transceiver
- The signal detect pin should be DC-coupled with an emitter current path for the fiber transceiver

Refer to the fiber transceiver manufacturer's recommendations for termination circuitry. [Figure 25](#) shows a typical example of an LXT971A-to-3.3 V fiber transceiver interface.

The following occurs in 5 V fiber transceiver applications as shown in [Figure 26](#):

- The transmit pair should be AC-coupled and re-biased to 5 V PECL input levels
- The receive pair should be AC-coupled with an emitter current path for the fiber transceiver and re-biased to 3.3 V LVPECL input levels.

The signal detect pin on a 5 V fiber transceiver interface should use the logic translator circuitry as shown in [Figure 27](#). Refer to the fiber transceiver manufacturer's recommendations for termination circuitry. [Figure 26](#) shows a typical example of an LXT971A-to-5 V fiber transceiver interface, while [Figure 27](#) shows the interface circuitry for the logic translator.

Figure 25. Typical LXT971A-to-3.3 V Fiber Transceiver Interface Circuitry

## 5.0 Test Specifications

**Note:** Table 17 through Table 40 and Figure 28 through Figure 41 represent the performance specifications of the LXT971A. These specifications are guaranteed by test except where noted “by design.” Minimum and maximum values listed in Table 19 through Table 40 apply over the recommended operating conditions specified in Table 18.

### 5.1 Electrical Parameters

**Table 17. Absolute Maximum Ratings**

Parameter		Sym	Min	Max	Units
Supply voltage		VCC	-0.3	4.0	V
Operating temperature	LXT971A_C (Commercial)	TOPA	-15	+85	°C
	LXT971A_E (Extended)	TOPA	-55	+100	°C
Storage temperature		TST	-65	+150	°C
<p><b>Caution:</b> Exceeding these values may cause permanent damage. Functional operation under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.</p>					

**Table 18. Operating Conditions**

Parameter		Sym	Min	Typ <sup>1</sup>	Max	Units
Recommended operating temperature	LXT971A_C (Commercial)	TOPA	0	–	70	°C
	LXT971A_E (Extended)	TOPA	-40	–	85	°C
Recommended supply voltage <sup>2</sup>	Analog & Digital	Vcca, Vccd	3.14	3.3	3.45	V
	I/O	Vccio	2.35	–	3.45	V
Vcc current	100BASE-TX	ICC	–	92	110	mA
	10BASE-T	ICC	–	66	82	mA
	100BASE-FX	ICC	–	72	95	mA
	Sleep Mode	ICC	–	40	45	mA
	Hard Power Down	ICC	–	–	1	mA
	Soft Power Down	ICC	–	51	–	mA
	Auto-Negotiation	ICC	–	90	110	mA
<p>1. Typical values are at 25 °C and are for design aid only; not guaranteed and not subject to production testing. 2. Voltages with respect to ground unless otherwise specified.</p>						

**Table 19. Digital I/O Characteristics<sup>2</sup>**

Parameter	Symbol	Min	Typ <sup>1</sup>	Max	Units	Test Conditions
Input Low voltage	V <sub>IL</sub>	–	–	0.8	V	–
Input High voltage	V <sub>IH</sub>	2.0	–	–	V	–
Input current	I <sub>I</sub>	-10	–	10	μA	0.0 < V <sub>I</sub> < V <sub>CC</sub>
Output Low voltage	V <sub>OL</sub>	–	–	0.4	V	I <sub>OL</sub> = 4 mA
Output High voltage	V <sub>OH</sub>	2.4	–	–	V	I <sub>OH</sub> = -4 mA

1. Typical values are at 25 °C and are for design aid only; not guaranteed and not subject to production testing.  
2. Applies to all pins except MII, LED, XI/XO, and SD/TP pins. Refer to [Table 20](#) for MII I/O Characteristics, [Table 21](#) for XI/XO and [Table 22](#) for LED Characteristics.

**Table 20. Digital I/O Characteristics - MII Pins**

Parameter	Symbol	Min	Typ <sup>1</sup>	Max	Units	Test Conditions
Input Low voltage	V <sub>IL</sub>	–	–	0.8	V	–
Input High voltage	V <sub>IH</sub>	2.0	–	–	V	–
Input current	I <sub>I</sub>	-10	–	10	μA	0.0 < V <sub>I</sub> < V <sub>CCIO</sub>
Output Low voltage	V <sub>OL</sub>	–	–	0.4	V	I <sub>OL</sub> = 4 mA
Output High voltage	V <sub>OH</sub>	2.2	–	–	V	I <sub>OH</sub> = -4 mA, V <sub>CCIO</sub> = 3.3V
	V <sub>OH</sub>	2.0	–	–	V	I <sub>OH</sub> = -4 mA, V <sub>CCIO</sub> = 2.5V
Driver output resistance (Line driver output enabled)	R <sub>O<sup>2</sup></sub>	–	100	–	W	V <sub>CCIO</sub> = 2.5V
	R <sub>O<sup>2</sup></sub>	–	100	–	W	V <sub>CCIO</sub> = 3.3V

1. Typical values are at 25 °C and are for design aid only; not guaranteed and not subject to production testing.  
2. Parameter is guaranteed by design; not subject to production testing.

**Table 21. I/O Characteristics - REFCLK/XI and XO Pins**

Parameter	Symbol	Min	Typ <sup>1</sup>	Max	Units	Test Conditions
Input Low Voltage	V <sub>IL</sub>	–	–	0.8	V	–
Input High Voltage	V <sub>IH</sub>	2.0	–	–	V	–
Input Clock Frequency Tolerance <sup>2</sup>	Δf	–	–	±100	ppm	–
Input Clock Duty Cycle <sup>2</sup>	T <sub>dc</sub>	35	–	65	%	–
Input Capacitance	C <sub>IN</sub>	–	3.0	–	pF	–

1. Typical values are at 25 °C and are for design aid only; not guaranteed and not subject to production testing.  
2. Parameter is guaranteed by design; not subject to production testing.

Table 22. I/O Characteristics - LED/CFG Pins

Parameter	Symbol	Min	Typ	Max	Units	Test Conditions
Input Low Voltage	V <sub>IL</sub>	–	–	0.8	V	–
Input High Voltage	V <sub>IH</sub>	2.0	–	–	V	–
Input Current	I <sub>I</sub>	-10	–	10	μA	0 < V <sub>I</sub> < V <sub>CCIO</sub>
Output Low Voltage	V <sub>OL</sub>	–	–	0.4	V	I <sub>OL</sub> = 10 mA
Output High Voltage	V <sub>OH</sub>	2.0	–	–	V	I <sub>OH</sub> = -10 mA

Table 23. I/O Characteristics – SD/TP Pin

Parameter	Sym	Min	Typ <sup>1</sup>	Max	Units	Test Conditions
<b>Reset and Power-Up States – FX/TP Mode Configuration</b>						
Fiber Mode (Register bit 16.0 = 1)	V <sub>FX</sub>	600	1600-2400	–	mV	–
Twisted-Pair Mode (Register bit 16.0 = 0)	V <sub>TP</sub>	–	GND	500	mV	–
<b>100BASE-FX Mode Normal Operation – SD Input from Fiber Transceiver</b>						
Input Low Voltage	V <sub>IL</sub>	1.49	1.6	1.83	V	V <sub>CCD</sub> = 3.3 V
Input High Voltage	V <sub>IH</sub>	2.14	2.4	2.42	V	V <sub>CCD</sub> = 3.3 V
1. Typical values are for design aid only; not guaranteed and not subject to production testing.						

Table 24. 100BASE-TX Transceiver Characteristics

Parameter	Symbol	Min	Typ <sup>1</sup>	Max	Units	Test Conditions
Peak differential output voltage	V <sub>P</sub>	0.95	–	1.05	V	Note 2
Signal amplitude symmetry	V <sub>SS</sub>	98	–	102	%	Note 2
Signal rise/fall time	TRF	3.0	–	5.0	ns	Note 2
Rise/fall time symmetry	TRFS	–	–	0.5	ns	Note 2
Duty cycle distortion	DCD	35	50	65	%	Offset from 16 ns pulse width at 50% of pulse peak
Overshoot/Undershoot	V <sub>OS</sub>	–	–	5	%	–
Jitter (measured differentially)	–	–	–	1.4	ns	–
1. Typical values are at 25 °C and are for design aid only; not guaranteed and not subject to production testing.						
2. Measured at the line side of the transformer, line replaced by 100Ω(+/-1%) resistor.						

**Table 25. 100BASE-FX Transceiver Characteristics**

Parameter	Symbol	Min	Typ <sup>1</sup>	Max	Units	Test Conditions
<b>Transmitter</b>						
Peak differential output voltage (single ended)	VOP	0.6	–	1.5	V	–
Signal rise/fall time	TRF	–	–	1.9	ns	10 <--> 90% 2.0 pF load
Jitter (measured differentially)	–	–	–	1.3	ns	–
<b>Receiver</b>						
Peak differential input voltage	VIP	0.55	–	1.5	V	–
Common mode input range	VCMIR	–	–	V <sub>CC</sub> - 0.7	V	–
1. Typical values are at 25 °C and are for design aid only; not guaranteed and not subject to production testing.						

**Table 26. 10BASE-T Transceiver Characteristics**

Parameter	Symbol	Min	Typ	Max	Units	Test Conditions
<b>Transmitter</b>						
Peak differential output voltage	VOP	2.2	2.5	2.8	V	With transformer, line replaced by 100 Ω resistor
Transition timing jitter added by the MAU and PLS sections	–	0	2	11	ns	After line model specified by IEEE 802.3 for 10BASE-T MAU
<b>Receiver</b>						
Receive Input Impedance	Z <sub>IN</sub>	–	–	22	kΩ	–
Differential Squelch Threshold	V <sub>DS</sub>	300	420	585	mV	–

**Table 27. 10BASE-T Link Integrity Timing Characteristics**

Parameter	Symbol	Min	Typ	Max	Units	Test Conditions
Time Link Loss Receive	TLL	50	–	150	ms	–
Link Pulse	TLP	2	–	7	Link Pulses	–
Link Min Receive Timer	TLR MIN	2	–	7	ms	–
Link Max Receive Timer	TLR MAX	50	–	150	ms	–
Link Transmit Period	Tlt	8	–	24	ms	–
Link Pulse Width	Tlpw	60	–	150	ns	–
1. Typical values are at 25 °C and are for design aid only; not guaranteed and not subject to production testing.						

**Table 28. LXT971A Thermal Characteristics**

Parameter	LXT971ALC	LXT971ALE	LXT971ABE
Package	10 x 10 x 1.4 64 LD LQFP	10 x 10 x 1.4 64 LQFP	7 x 7 x .96 64 BGA-CSP
Theta-JA	58 C/W	56 C/W	42 C/W
Theta-JC	27 C/W	25 C/W	20 C/W
Psi - JT	3.4 C/W	3.0 C/W	—

## 5.2 Timing Diagrams

Figure 28. 100BASE-TX Receive Timing - 4B Mode

Table 29. 100BASE-TX Receive Timing Parameters - 4B Mode

Parameter	Sym	Min	Typ <sup>1</sup>	Max	Units <sup>2</sup>	Test Conditions
RXD<3:0>, RX_DV, RX_ER setup to RX_CLK High	t1	10	–	–	ns	–
RXD<3:0>, RX_DV, RX_ER hold from RX_CLK High	t2	10	–	–	ns	–
CRS asserted to RXD<3:0>, RX_DV	t3	3	–	5	BT	–
Receive start of “J” to CRS asserted	t4	12	–	16	BT	–
Receive start of “T” to CRS de-asserted	t5	10	–	17	BT	–
Receive start of “J” to COL asserted	t6	16	–	22	BT	–
Receive start of “T” to COL de-asserted	t7	17	–	20	BT	–

1. Typical values are at 25 °C and are for design aid only; not guaranteed and not subject to production testing.  
 2. BT is the duration of one bit as transferred to and from the MAC and is the reciprocal of the bit rate. 100BASE-T bit time = 10<sup>-8</sup> s or 10 ns.

Figure 29. 100BASE-TX Transmit Timing - 4B Mode

Table 30. 100BASE-TX Transmit Timing Parameters - 4B Mode

Parameter	Symbol	Min	Typ <sup>1</sup>	Max	Units <sup>2</sup>	Test Conditions
TXD<3:0>, TX_EN, TX_ER setup to TX_CLK High	t1	12	-	-	ns	-
TXD<3:0>, TX_EN, TX_ER hold from TX_CLK High	t2	0	-	-	ns	-
TX_EN sampled to CRS asserted	t3	20	-	24	BT	-
TX_EN sampled to CRS de-asserted	t4	24	-	28	BT	-
TX_EN sampled to TPFO out (Tx latency)	t5	5.3	-	5.7	BT	-

1. Typical values are at 25 °C and are for design aid only; not guaranteed and not subject to production testing.  
 2. BT is the duration of one bit as transferred to and from the MAC and is the reciprocal of the bit rate. 100BASE-T bit time = 10<sup>-8</sup> s or 10 ns.

Figure 30. 100BASE-FX Receive Timing

Table 31. 100BASE-FX Receive Timing Parameters

Parameter	Sym	Min	Typ <sup>1</sup>	Max	Units <sup>2</sup>	Test Conditions
RXD<3:0>, RX_DV, RX_ER setup to RX_CLK High	t1	10	–	–	ns	–
RXD<3:0>, RX_DV, RX_ER hold from RX_CLK High	t2	10	–	–	ns	–
CRS asserted to RXD<3:0>, RX_DV	t3	3	–	5	BT	–
Receive start of "J" to CRS asserted	t4	12	–	16	BT	–
Receive start of "T" to CRS de-asserted	t5	16	–	22	BT	–
Receive start of "J" to COL asserted	t6	10	–	15	BT	–
Receive start of "T" to COL de-asserted	t7	14	–	18	BT	–

1. Typical values are at 25 °C and are for design aid only; not guaranteed and not subject to production testing.  
 2. BT is the duration of one bit as transferred to and from the MAC and is the reciprocal of the bit rate. 100BASE-T bit time = 10<sup>-8</sup> s or 10 ns.

Figure 31. 100BASE-FX Transmit Timing

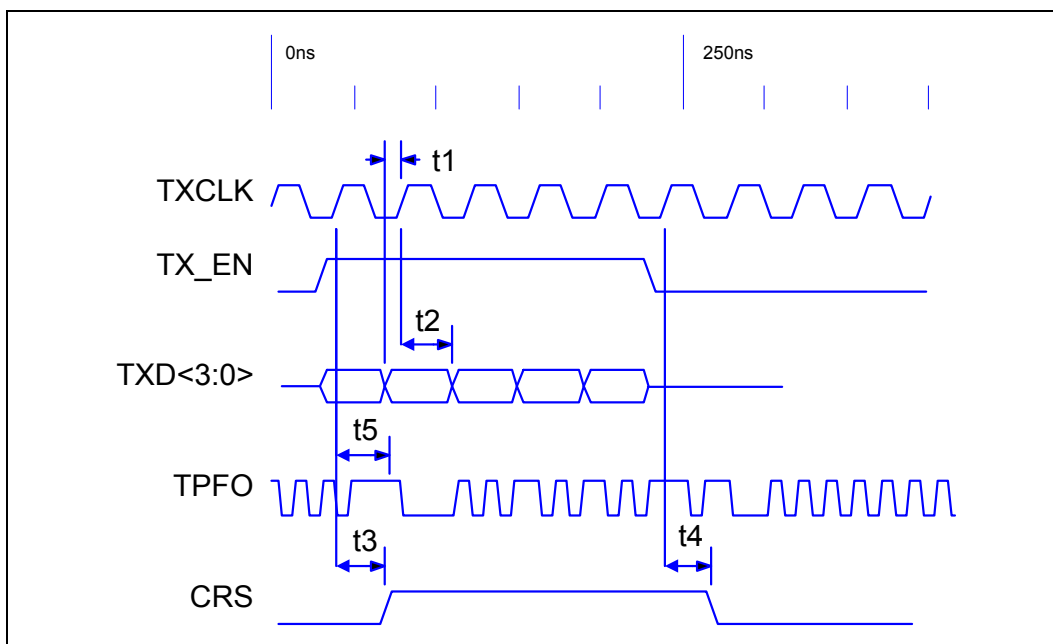

Table 32. 100BASE-FX Transmit Timing Parameters

Parameter	Symbol	Min	Typ <sup>1</sup>	Max	Units <sup>2</sup>	Test Conditions
TXD<3:0>, TX_EN, TX_ER setup to TX_CLK High	t1	12	–	–	ns	–
TXD<3:0>, TX_EN, TX_ER hold from TX_CLK High	t2	0	–	–	ns	–
TX_EN sampled to CRS asserted	t3	17	–	20	BT	–
TX_EN sampled to CRS de-asserted	t4	22	–	24	BT	–
TX_EN sampled to TPFO out (Tx latency)	t5	5	–	5.3	BT	–

1. Typical values are at 25 °C and are for design aid only; not guaranteed and not subject to production testing.  
 2. BT is the duration of one bit as transferred to and from the MAC and is the reciprocal of the bit rate. 100BASE-T bit time = 10<sup>-8</sup> s or 10 ns.

Figure 32. 10BASE-T Receive Timing

Table 33. 10BASE-T Receive Timing Parameters

Parameter	Sym	Min	Typ <sup>1</sup>	Max	Units <sup>2</sup>	Test Conditions
RXD, RX_DV, RX_ER Setup to RX_CLK High	t1	10	–	–	ns	–
RXD, RX_DV, RX_ER Hold from RX_CLK High	t2	10	–	–	ns	–
TPFiP/N in to RXD out (Rx latency)	t3	4.2	–	6.6	BT	–
CRS asserted to RXD, RX_DV, RX_ER asserted	t4	5	–	32	BT	–
RXD, RX_DV, RX_ER de-asserted to CRS de-asserted	t5	0.3	–	0.5	BT	–
TPFi in to CRS asserted	t6	2	–	28	BT	–
TPFi quiet to CRS de-asserted	t7	6	–	10	BT	–
TPFi in to COL asserted	t8	1	–	31	BT	–
TPFi quiet to COL de-asserted	t9	5	–	10	BT	–

1. Typical values are at 25 °C and are for design aid only; not guaranteed and not subject to production testing.  
 2. BT is the duration of one bit as transferred to and from the MAC and is the reciprocal of the bit rate. 10BASE-T bit time = 10<sup>-7</sup> s or 100 ns.

Figure 33. 10BASE-T Transmit Timing

Table 34. 10BASE-T Transmit Timing Parameters

Parameter	Symbol	Min	Typ <sup>1</sup>	Max	Units <sup>2</sup>	Test Conditions
TXD, TX_EN, TX_ER setup to TX_CLK High	t1	10	–	–	ns	–
TXD, TX_EN, TX_ER hold from TX_CLK High	t2	0	–	–	ns	–
TX_EN sampled to CRS asserted	t3	–	2	–	BT	–
TX_EN sampled to CRS de-asserted	t4	–	1	–	BT	–
TX_EN sampled to TPFO out (Tx latency)	t5	–	72.5	–	BT	–

1. Typical values are at 25 °C and are for design aid only; not guaranteed and not subject to production testing.  
 2. BT is the duration of one bit as transferred to and from the MAC and is the reciprocal of the bit rate. 10BASE-T bit time = 10<sup>-7</sup> s or 100 ns.

Figure 34. 10BASE-T Jabber and Unjabber Timing

Table 35. 10BASE-T Jabber and Unjabber Timing Parameters

Parameter	Symbol	Min	Typ <sup>1</sup>	Max	Units	Test Conditions
Maximum transmit time	t1	20	–	150	ms	–
Unjab time	t2	250	–	750	ms	–

1. Typical values are at 25 °C and are for design aid only; not guaranteed and not subject to production testing.

Figure 35. 10BASE-T SQE (Heartbeat) Timing

Table 36. 10BASE-T SQE Timing Parameters

Parameter	Symbol	Min	Typ <sup>1</sup>	Max	Units	Test Conditions
COL (SQE) Delay after TX_EN off	t1	0.65	–	1.6	us	–
COL (SQE) Pulse duration	t2	0.5	–	1.5	us	–

1. Typical values are at 25 °C and are for design aid only; not guaranteed and not subject to production testing.

Figure 36. Auto-Negotiation and Fast Link Pulse Timing

Figure 37. Fast Link Pulse Timing

Table 37. Auto-Negotiation and Fast Link Pulse Timing Parameters

Parameter	Symbol	Min	Typ <sup>1</sup>	Max	Units	Test Conditions
Clock/Data pulse width	t1	–	100	–	ns	–
Clock pulse to Data pulse	t2	55.5	–	63.8	μs	–
Clock pulse to Clock pulse	t3	123	–	127	μs	–
FLP burst width	t4	–	2	–	ms	–
FLP burst to FLP burst	t5	8	12	24	ms	–
Clock/Data pulses per burst	–	17	–	33	ea	–

1. Typical values are at 25 °C and are for design aid only; not guaranteed and not subject to production testing.

Figure 38. MDIO Input Timing

Figure 39. MDIO Output Timing

Table 38. MDIO Timing Parameters

Parameter	Symbol	Min	Typ <sup>1</sup>	Max	Units	Test Conditions
MDIO setup before MDC, sourced by STA	t1	10	–	–	ns	–
MDIO hold after MDC, sourced by STA	t2	5	–	–	ns	–
MDC to MDIO output delay, source by PHY	t3	–	–	150	ns	–
MDC period	t4	125	–	–	ns	MDC = 8 MHz

1. Typical values are at 25° C and are for design aid only; not guaranteed and not subject to production testing.

Figure 40. Power-Up Timing

Table 39. Power-Up Timing Parameters

Parameter	Symbol	Min	Typ <sup>1</sup>	Max	Units	Test Conditions
Voltage threshold	v1	–	2.9	–	V	–
Power Up delay <sup>2</sup>	t1	–	–	300	μs	–

1. Typical values are at 25° C and are for design aid only; not guaranteed and not subject to production testing.  
 2. Power-up delay is specified as a maximum value because it refers to the PHY guaranteed performance - the PHY comes out of reset after a delay of No MORE Than 300 μs. System designers should consider this as a minimum value - After threshold v1 is reached, the MAC should delay No LESS Than 300 μs before accessing the MDIO port.

Figure 41. RESET Pulse Width and Recovery Timing

Table 40. RESET Pulse Width and Recovery Timing Parameters

Parameter	Symbol	Min	Typ <sup>1</sup>	Max	Units	Test Conditions
RESET pulse width	t1	10	–	–	ns	–
RESET recovery delay <sup>2</sup>	t2	–	–	300	μs	–

1. Typical values are at 25° C and are for design aid only; not guaranteed and not subject to production testing.  
 2. Reset Recovery Delay is specified as a maximum value because it refers to the PHY guaranteed performance - the PHY comes out of reset after a delay of No MORE Than 300 μs. System designers should consider this as a minimum value - After de-asserting RESET\*, the MAC should delay No LESS Than 300 μs before accessing the MDIO port.

## 6.0 Register Definitions

The LXT971A register set includes multiple 16-bit registers. [Table 41](#) presents a complete register listing. [Table 42](#) is a complete memory map of all registers and [Tables 43 through 58](#) provide individual register definitions.

Base registers (0 through 8) are defined in accordance with the “Reconciliation Sublayer and Media Independent Interface” and “Physical Layer Link Signaling for 10/100 Mbps Auto-Negotiation” sections of the IEEE 802.3 standard.

Additional registers are defined in accordance with the IEEE 802.3 standard for adding unique chip functions.

**Table 41. Register Set**

Address	Register Name	Bit Assignments
0	Control Register	Refer to <a href="#">Table 43 on page 74</a>
1	Status Register #1	Refer to <a href="#">Table 44 on page 75</a>
2	PHY Identification Register 1	Refer to <a href="#">Table 45 on page 76</a>
3	PHY Identification Register 2	Refer to <a href="#">Table 46 on page 76</a>

4.5	10BASE-T	1 = Port is 10BASE-T capable. 0 = Port is not 10BASE-T capable.	R/W	Note 3
4.4:0	Selector Field, S<4:0>	<00001> = IEEE 802.3. <00010> = IEEE 802.9 ISLAN-16T. <00000> = Reserved for future auto-negotiation development. <11111> = Reserved for future auto-negotiation development. Unspecified or reserved combinations should not be transmitted.	R/W	00001

1. R/W = Read/Write  
RO = Read Only

2. The default setting of Register bit 4.10 (PAUSE) is determined by pin 33/H8 at reset.

3. Default values of Register bits 4.5, 4.6, 4.7, and 4.8 are determined by LED/CFGn pins at reset. Refer to [Table 9](#) for details.

Table 48. Auto-Negotiation Link Partner Base Page Ability Register (Address 5)

Bit	Name	Description	Type <sup>1</sup>	Default
5.15	Next Page	1 = Link Partner has ability to send multiple pages. 0 = Link Partner has no ability to send multiple pages.	RO	N/A
5.14	Acknowledge	1 = Link Partner has received Link Code Word from LXT971A. 0 = Link Partner has not received Link Code Word from the LXT971A.	RO	N/A
5.13	Remote Fault	1 = Remote fault. 0 = No remote fault.	RO	N/A
5.12	Reserved	Ignore.	RO	N/A
5.11	Asymmetric Pause	Pause operation defined in Clause 40 and 27. 1 = Link Partner is Pause capable. 0 = Link Partner is not Pause capable.	RO	N/A
5.10	Pause	1 = Link Partner is Pause capable. 0 = Link Partner is not Pause capable.	RO	N/A
5.9	100BASE-T4	1 = Link Partner is 100BASE-T4 capable. 0 = Link Partner is not 100BASE-T4 capable.	RO	N/A
5.8	100BASE-TX full-duplex	1 = Link Partner is 100BASE-TX full-duplex capable. 0 = Link Partner is not 100BASE-TX full-duplex capable.	RO	N/A
5.7	100BASE-TX	1 = Link Partner is 100BASE-TX capable. 0 = Link Partner is not 100BASE-TX capable.	RO	N/A
5.6	10BASE-T full-duplex	1 = Link Partner is 10BASE-T full-duplex capable. 0 = Link Partner is not 10BASE-T full-duplex capable.	RO	N/A
5.5	10BASE-T	1 = Link Partner is 10BASE-T capable. 0 = Link Partner is not 10BASE-T capable.	RO	N/A
5.4:0	Selector Field S<4:0>	<00001> = IEEE 802.3. <00010> = IEEE 802.9 ISLAN-16T. <00000> = Reserved for future auto-negotiation development. <11111> = Reserved for future auto-negotiation development. Unspecified or reserved combinations shall not be transmitted.	RO	N/A
1. RO = Read Only				

**Table 49. Auto-Negotiation Expansion (Address 6)**

Bit	Name	Description	Type <sup>1</sup>	Default
6.15:6	Reserved	Ignore on read.	RO	0
6.5	Base Page	This bit indicates the status of the auto-negotiation variable base page. It flags synchronization with the auto-negotiation state diagram, allowing detection of interrupted links. This bit is only used if Register bit 16.1 (Alternate NP feature) is set. 1 = Base page = true 0 = Base page = false	RO/ LH	0
6.4	Parallel Detection Fault	1 = Parallel detection fault has occurred. 0 = Parallel detection fault has not occurred.	RO/ LH	0
6.3	Link Partner Next Page Able	1 = Link partner is next page able. 0 = Link partner is not next page able.	RO	0
6.2	Next Page Able	1 = Local device is next page able. 0 = Local device is not next page able.	RO	1
6.1	Page Received	1 = Indicates that a new page has been received and the received code word has been loaded into Register 5 (Base Pages) or Register 8 (Next Pages) as specified in Clause 28 of IEEE 802.3. This bit is cleared on Read. If Register bit 16.1 is set, the Page Received bit is also cleared when mr_page_rx = false or transmit_disable = true.	RO LH	0
6.0	Link Partner A/N Able	1 = Link partner is auto-negotiation able. 0 = Link partner is not auto-negotiation able.	RO	0
1. RO = Read Only LH = Latching High				

**Table 50. Auto-Negotiation Next Page Transmit Register (Address 7)**

Bit	Name	Description	Type <sup>1</sup>	Default
7.15	Next Page (NP)	1 = Additional next pages follow 0 = Last page	R/W	0
7.14	Reserved	Write as 0, ignore on read	RO	0
7.13	Message Page (MP)	1 = Message page 0 = Unformatted page	R/W	1
7.12	Acknowledge 2 (ACK2)	1 = Complies with message 0 = Cannot comply with message	R/W	0
7.11	Toggle (T)	1 = Previous value of the transmitted Link Code Word equalled logic zero 0 = Previous value of the transmitted Link Code Word equalled logic one	R/W	0
7.10:0	Message/Unformatted Code Field		R/W	00000000 001
1. RO = Read Only. R/W = Read/Write				

Table 51. Auto-Negotiation Link Partner Next Page Receive Register (Address 8)

Bit	Name	Description	Type <sup>1</sup>	Default
8.15	Next Page (NP)	1 = Link Partner has additional next pages to send 0 = Link Partner has no additional next pages to send	RO	0
8.14	Acknowledge (ACK)	1 = Link Partner has received Link Code Word from LXT971A 0 = Link Partner has not received Link Code Word from LXT971A	RO	0
8.13	Message Page (MP)	1 = Page sent by the Link Partner is a Message Page 0 = Page sent by the Link Partner is an Unformatted Page	RO	0
8.12	Acknowledge 2 (ACK2)	1 = Link Partner complies with the message 0 = Link Partner cannot comply with the message	RO	0
8.11	Toggle (T)	1 = Previous value of the transmitted Link Code Word equalled logic zero 0 = Previous value of the transmitted Link Code Word equalled logic one	RO	0
8.10:0	Message/Unformatted Code Field	User definable	RO	0
1. RO = Read Only.				

**Table 52. Configuration Register (Address 16, Hex 10)**

Bit	Name	Description	Type <sup>1</sup>	Default
16.15	Reserved	Write as zero, ignore on read.	R/W	0
16.14	Force Link Pass	1 = Force Link pass 0 = Normal operation	R/W	0
16.13	Transmit Disable	1 = Disable Twisted Pair transmitter 0 = Normal Operation	R/W	0
16.12	Bypass Scrambler (100BASE-TX)	1 = Bypass Scrambler and Descrambler 0 = Normal Operation	R/W	0
16.11	Reserved	Ignore	R/W	0
16.10	Jabber (10BASE-T)	1 = Disable Jabber Correction 0 = Normal operation	R/W	0
16.9	SQE (10BASE-T)	1 = Enable Heart Beat 0 = Disable Heart Beat	R/W	0
16.8	TP Loopback (10BASE-T)	1 = Disable TP loopback during half-duplex operation 0 = Normal Operation	R/W	0
16.7	CRS Select (10BASE-T)	1 = CRS deassert extends to RX_DV deassert 0 = Normal Operation	R/W	1
16.6	Sleep Mode	1 = Enable Sleep Mode 0 = Disable Sleep Mode	R/W	Note 2
16.5	PRE_EN	Preamble Enable. 0 = Set RX_DV high coincident with SFD. 1 = Set RX_DV high and RXD = preamble when CRS is asserted.	R/W	0
16.4:3	Sleep Timer	00 = 3.04 seconds 01 = 2.00 seconds 10 = 1.04 seconds	R/W	00
16.2	Fault Code Enable	1 = Enable FEFI transmission 0 = Disable FEFI transmission	R/W	1
16.1	Alternate NP feature	1 = Enable alternate auto negotiate next page feature. 0 = Disable alternate auto negotiate next page feature	R/W	0
16.0	Fiber Select	1 = Select fiber mode. 0 = Select TP mode.	R/W	Note 3
1. R/W = Read /Write LHR = Latches High on Reset 2. The default value of Register bit 16.6 is determined by the state of the SLEEP pin 32/H7. 3. The default value of Register bit 16.0 is determined by pin 26/G2 (SD/TP).				

Table 53. Status Register #2 (Address 17)

Bit	Name	Description	Type <sup>1</sup>	Default
17.15	Reserved	Always 0.	RO	0
17.14	10/100 Mode	1 = LXT971A is operating in 100BASE-TX mode. 0 = LXT971A is not operating 100BASE-TX mode.	RO	0
17.13	Transmit Status	1 = LXT971A is transmitting a packet. 0 = LXT971A is not transmitting a packet.	RO	0
17.12	Receive Status	1 = LXT971A is receiving a packet. 0 = LXT971A is not receiving a packet.	RO	0
17.11	Collision Status	1 = Collision is occurring. 0 = No collision.	RO	0
17.10	Link	1 = Link is up. 0 = Link is down.	RO	0
17.9	Duplex Mode	1 = Full-duplex. 0 = Half-duplex.	RO	0
17.8	Auto-Negotiation	1 = LXT971A is in auto-negotiation mode. 0 = LXT971A is in manual mode.	RO	0
17.7	Auto-Negotiation Complete	1 = Auto-negotiation process completed. 0 = Auto-negotiation process not completed. This bit is only valid when auto negotiate is enabled, and is equivalent to Register bit 1.5.	RO	0
17.6	Reserved	Always 0.	RO	0
17.5	Polarity	1 = Polarity is reversed. 0 = Polarity is not reversed.	RO	0
17.4	Pause	1 = Device Pause capable. 0 = Device Not Pause capable.	RO	0
17:3	Error	1 = Error Occurred (Remote Fault, X,Y, Z). 0 = No error occurred.	RO	0
17:2	Reserved	Always 0.	RO	0
17:1	Reserved	Always 0.	RO	0
17.0	Reserved	Always 0.	RO	0

1. RO = Read Only. R/W = Read/Write

**Table 54. Interrupt Enable Register (Address 18)**

Bit	Name	Description	Type <sup>1</sup>	Default
18.15:9	Reserved	Write as 0; ignore on read.	R/W	N/A
18.8	Reserved	Write as 0; ignore on read.	R/W	0
18.7	ANMSK	Mask for Auto Negotiate Complete 1 = Enable event to cause interrupt. 0 = Do not allow event to cause interrupt.	R/W	0
18.6	SPEEDMSK	Mask for Speed Interrupt 1 = Enable event to cause interrupt. 0 = Do not allow event to cause interrupt.	R/W	0
18.5	DUPLEXMSK	Mask for Duplex Interrupt 1 = Enable event to cause interrupt. 0 = Do not allow event to cause interrupt.	R/W	0
18.4	LINKMSK	Mask for Link Status Interrupt 1 = Enable event to cause interrupt. 0 = Do not allow event to cause interrupt.	R/W	0
18.3	Reserved	Write as 0, ignore on read.	R/W	0
18.2	Reserved	Write as 0, ignore on read.	R/W	0
18.1	INTEN	1 = Enable interrupts. 0 = Disable interrupts.	R/W	0
18.0	TINT	1 = Force interrupt on MDINT. 0 = Normal operation.	R/W	0
1. R/W = Read /Write				

Table 55. Interrupt Status Register (Address 19, Hex 13)

Bit	Name	Description	Type <sup>1</sup>	Default
19.15:9	Reserved	Ignore	RO	N/A
19.8	Reserved	Ignore	RO	0
19.7	ANDONE	Auto-negotiation Status 1= Auto-negotiation has completed. 0= Auto-negotiation has not completed.	RO/SC	N/A
19.6	SPEEDCHG	Speed Change Status 1 = A Speed Change has occurred since last reading this register. 0 = A Speed Change has not occurred since last reading this register.	RO/SC	0
19.5	DUPLEXCHG	Duplex Change Status 1 = A Duplex Change has occurred since last reading this register. 0 = A Duplex Change has not occurred since last reading this register.	RO/SC	0
19.4	LINKCHG	Link Status Change Status 1 = A Link Change has occurred since last reading this register. 0 = A Link Change has not occurred since last reading this register.	RO/SC	0
19.3	Reserved	Ignore.	RO	0
19.2	$\overline{\text{MDINT}}$	1 = MII interrupt pending. 0 = No MII interrupt pending.	RO	
19.1	Reserved	Ignore.	RO	N/A
19.0	Reserved	Ignore	RO	0
1. R/W = Read/Write, RO = Read Only, SC = Self Clearing.				

Table 56. LED Configuration Register (Address 20, Hex 14)

Bit	Name	Description	Type <sup>1</sup>	Default
20.15:12	LED1 Programming bits	0000 = Display Speed Status (Continuous, Default) 0001 = Display Transmit Status (Stretched) 0010 = Display Receive Status (Stretched) 0011 = Display Collision Status (Stretched) 0100 = Display Link Status (Continuous) 0101 = Display Duplex Status (Continuous) 0110 = Unused 0111 = Display Receive or Transmit Activity (Stretched) 1000 = Test mode- turn LED on (Continuous) 1001 = Test mode- turn LED off (Continuous) 1010 = Test mode- blink LED fast (Continuous) 1011 = Test mode- blink LED slow (Continuous) 1100 = Display Link and Receive Status combined <sup>2</sup> (Stretched) <sup>3</sup> 1101 = Display Link and Activity Status combined <sup>2</sup> (Stretched) <sup>3</sup> 1110 = Display Duplex and Collision Status combined <sup>4</sup> (Stretched) <sup>3</sup> 1111 = Unused	R/W	0000
20.11:8	LED2 Programming bits	0000 = Display Speed Status 0001 = Display Transmit Status 0010 = Display Receive Status 0011 = Display Collision Status 0100 = Display Link Status (Default) 0101 = Display Duplex Status 0110 = Unused 0111 = Display Receive or Transmit Activity 1000 = Test mode- turn LED on 1001 = Test mode- turn LED off 1010 = Test mode- blink LED fast 1011 = Test mode- blink LED slow 1100 = Display Link and Receive Status combined <sup>2</sup> (Stretched) <sup>3</sup> 1101 = Display Link and Activity Status combined <sup>2</sup> (Stretched) <sup>3</sup> 1110 = Display Duplex and Collision Status combined <sup>4</sup> (Stretched) <sup>3</sup> 1111 = Unused	R/W	0100
1. R/W = Read /Write RO = Read Only LH = Latching High 2. Link status is the primary LED driver. The LED is asserted (solid ON) when the link is up. The secondary LED driver (Receive or Activity) causes the LED to change state (blink). 3. Combined event LED settings are not affected by Pulse Stretch Register bit 20.1. These display settings are stretched regardless of the value of 20.1. 4. Duplex status is the primary LED driver. The LED is asserted (solid ON) when the link is full-duplex. Collision status is the secondary LED driver. The LED changes state (blinks) when a collision occurs. 5. Values are relative approximations. Not guaranteed or production tested.				

Table 56. LED Configuration Register (Address 20, Hex 14) (Continued)

Bit	Name	Description	Type <sup>1</sup>	Default

# Revision History

Revision Number: 010 Revision Date: January 13, 2005	
Page #	Description
13	Revised <a href="#">Figure 1</a> , "Example of Pb-Free LQFP Package for Intel® LXT971A, LX972A, and LXT972M Transceivers" and descriptive text that references this figure.
14	Revised <a href="#">Figure 2</a> , "Example of LQFP Package for Intel® LXT971A, LXT972A, and LXT972M Transceivers" and descriptive text that references this figure.
24	Revised <a href="#">Table 2</a> , "Product Information".
25	Revised <a href="#">Figure 5</a> , "Ordering Information - Sample".

Revision Number: 009 Revision Date: September 17, 2004	
Page #	Description
-	Added the LXT972M Single-Port 10/100 Mbps PHY Transceiver where appropriate.
17	Revised Erratum item 4. Clarified workaround.
18	Revised Erratum item 5. Moved previous Note to Errata table.
19	Revised Erratum item 9. Moved previous Note to Errata table.
19	Revised Erratum item 10. Moved previous Note to Errata table.
19	Revised Erratum item 11. Moved previous Note to Errata table.
26	Revised " <a href="#">Sightings</a> " section.

Revision Number: 008 Revision Date: December 2, 2003	
Page #	Description
10	Added Errata items 13 through 15 to " <a href="#">Errata</a> " table.
10	Removed Item 1 in " <a href="#">Specification Clarifications</a> " table.
12	Modified steppings table under " <a href="#">Identification Information</a> " section (added JTAG ID information).
17	Added Erratum 13: " <a href="#">Changing Advertised Duplex While Link Is Up</a> " to " <a href="#">Errata</a> " section.
17	Added Erratum 14: " <a href="#">Far-End Fault Reporting</a> " to " <a href="#">Errata</a> " section.
18	Added Erratum 15: " <a href="#">Detection of Illegal Symbols After SSD</a> " to " <a href="#">Errata</a> " section.
20	Incorporated tables under " <a href="#">Specification Clarifications</a> " into the LXT971A and LXT972A Datasheets and removed from this document.
22	Incorporated "Item 3: Increased MII Drive Strength" under the " <a href="#">Addenda</a> " section into the LXT971A and LXT972A Datasheets and removed from this document.

Revision Number: 007 Revision Date: May 17, 2002	
Page #	Description
4	Updated "Affected Documents" Table.
8	Updated "Codes Used in Summary Table".
7	Updated "Errata" Listing.
12	Added Erratum: "Switching Clocks from 100 Mbps to 10 Mbps Prior to End of Packet".
16	Added Addendum: "Increased MII Drive Strength".

Revision Number: 006 Revision Date: August 17, 2001	
Page #	Description
7	Documentation Changes: Modified to reflect document rev numbers.
14	Modified Absolute Maximum Ratings table.

Revision Number: 005 Revision Date: June 27, 2001	
Page #	Description
16	Addenda: Clarified Description 1.

Revision Number: 004 Revision Date: June 20, 2001	
Page #	Description
15	Added Product Ordering Information

Revision Number: 003 Revision Date: May 9, 2001	
Page #	Description
7	Errata 7, 9, 10, 11, 12 were fixed in Stepping 2. Removed "Xs" for correct status.

Revision Number: 002 Revision Date: March 20, 2001	
Page #	Description
8	Updated "Markings" table with Manufacturer's Revision Code information.
11	Replaced text with "None" for Workaround under Errata 9.
12	Added BSDL text to Workaround under Errata 11.

Date	Version	Page #	Description
January 15, 2001	001	-	Converted to Intel format (no technical or material changes).
August 24, 2000	2.1 <sup>1</sup>	-	Added errata for Stepping 2.
June 27, 2000	2.0 <sup>1</sup>	-	Reformatted and added errata for Stepping 1.
November 5, 1999	1.n <sup>1</sup>	-	Various versions covered silicon Stepping 0.
1. Level One document version number. As of 1/ 15,/01, this document replaces the Level One document.			

## Preface

---

This document is an update to the specifications contained in the Affected Documents/Related Documents table below. This document is a compilation of device and documentation errata, specification clarifications and changes. It is intended for hardware system manufacturers and software developers of applications, operating systems, or tools.

Information types defined in Nomenclature are consolidated into the specification update and are no longer published in other documents.

This document may also contain information that was not previously published.

Stepping 2 devices are labeled as LXT971A, LXT972A, and LXT972M Transceivers.

## Affected Documents/Related Documents

Title	Order
Intel® LXT971A 3.3V Dual-Speed Fast Ethernet Transceiver Datasheet	249185
Intel® LXT972A 3.3V Dual-Speed Fast Ethernet Transceiver Datasheet	249186
Intel® LXT971A/972A 3.3V PHY Transceivers Design and Layout Guide Application Note	249016
Intel® LXT971A — LXT970A-to-LXT971A Migration Application Note	249028

Intel® LXD971L Demo Board for 3.3V 10/100 Applications (Board Rev B2) Development Kit Manual	249247
Intel® LXT972M Single-Port 10/100 Mbps PHY Transceiver Datasheet	302875
Intel® LXT972M Transceiver Demo Board (Board Rev A1)	303125

## Nomenclature

**Errata** are design defects or errors. These may cause the behaviors of the following to deviate from published specifications:

- LXT971/LXT971A 3.3V Dual-Speed Fast Ethernet Transceiver (called hereafter the LXT971A Transceiver)
- LXT972/LXT972A 3.3V Dual-Speed Fast Ethernet Transceiver (called hereafter the LXT972A Transceiver)
- LXT972M Single-Port 10/100 Mbps PHY Transceiver (called hereafter the LXT972M Transceiver).

Hardware and software designed to be used with any given stepping must assume that all errata documented for that stepping are present on all devices.

**Specification Changes** are modifications to the current published specifications. These changes will be incorporated in any new release of the specification.

**Specification Clarifications** describe a specification in greater detail or further highlight a specification's impact to a complex design situation. These clarifications will be incorporated in any new release of the specification.

**Documentation Changes** include typos, errors, or omissions from the current published specifications. These will be incorporated in any new release of the specification.

**Note:** Errata remain in the specification update throughout the product's lifecycle, or until a particular stepping is no longer commercially available. Under these circumstances, errata removed from the specification update are archived and available upon request. Specification changes, specification clarifications and documentation changes are removed from the specification update when the appropriate changes are made to the appropriate product specification or user documentation (datasheets, manuals, and so on).

# Summary Table of Changes

---

The following table indicates the errata, specification changes, or specification clarifications which apply to the LXT971A, LXT972A, and LXT972M Transceivers. Intel may fix some of the errata in a future stepping of the component, and account for the other outstanding issues through documentation or specification changes as noted. This table uses the following notations:

## Codes Used in Summary Table

### Stepping

X: Errata that applies to this stepping.  
(No mark) or (Blank box): This erratum is fixed in stepping indicated. Specification Change or Specification Clarification does not apply to this stepping.

### Page

(Page): Page location of item in this document.

### Status

Doc: Document change or update will be implemented.  
Plan Fix: This erratum may be fixed in a future stepping of the product.  
Fixed: This erratum has been previously fixed.  
No Fix: There are no plans to fix this erratum.

### Row

Change bar to left of table row indicates this erratum is either new or modified from the previous version of the document.

## Errata

No.	LXT971A/LXT972A Transceiver Steppings <sup>1,2,3</sup>			Page	Status	ERRATA
	0	1	2			
1	X			13	Fixed	"Incorrect Auto-Negotiation Link Partner Base Page Ability Register"
2	X			13	Fixed	"Incorrect Auto-Negotiation Next Page"
3	X			13	Fixed	"Incorrect Remote Fault"
4	X			13	Fixed	"Incorrect Auto-Negotiation Duplex Status"
5	X	X		14	Fixed	"Incorrect JTAG Revision Code"
6	X	X		14	Fixed	"Incorrect Duplex - Collision LED Display"
7	X	X		15	Fixed	"Incorrect Activity LED Display"
8	X			15	Fixed	"MII Pins Not Three-Stateable"
9	X	X		15	Fixed	"100 M External Loopback Using Short Cable Length"
10	X	X		16	Fixed	"10BASE-T Data Inversion"
11	X	X		16	Fixed	"Power Cycling and JTAG TRST Reset Pin"
12	X	X		16	Fixed	"Switching Clocks from 100 Mbps to 10 Mbps Prior to End-of-Packet"
13	X	X	X	17	NoFix	"Changing Advertised Duplex While Link Is Up"
14	X	X	X	17	NoFix	"Far-End Fault Reporting"
15	X	X	X	17	NoFix	"Detection of Illegal Symbols After SSD"

1. Refer to "Markings" on page 12 for codes to identify various silicon steppings.  
2. Devices with an A suffix (such as the LXT971A and LXT972A Transceiver) are Stepping 2.  
3. The LXT972M Transceiver is available only as Stepping 2.

## Specification Changes

No.	Steppings			Page	Status	SPECIFICATION CHANGES
	#	#	#			
						None for this revision of this specification update.

## Specification Clarifications

No.	Steppings			Page	Status	SPECIFICATION CLARIFICATIONS
						None for this revision of this specification update.

## Documentation Changes

No.	Datasheet Revision	Page	Status	Documentation Changes
1	LXT971A - 002 LXT972A - 003	21	Doc	Table 1, "Product Information" and Figure 1, "Ordering Information - Sample"

## Sightings

No.	LXT971A/LXT972A Transceiver Steppings <sup>1,2</sup>			Page	Status	Sightings
	0	1	2			
1	X	X		13	Fixed	Sighting 1, "100BASE-TX Receive Jitter Tolerance"
2	X	X		13	Fixed	Sighting 2, "10BASE-T Jitter Tolerance"
1. Refer to "Markings" on page 12 for codes to identify various silicon steppings. 2. The LXT972M Transceiver is available only as Stepping 2.						

# Identification Information

## Markings

This section shows the markings for the LXT971A, LXT972A, and LXT972M Transceivers.

The LXT971A, LXT972A, and LXT972M Transceivers are available in both Low Profile Quad Flat Pack (LQFP) and Pb-free LQFP packages. [Figure 1](#) shows a sample Pb-free LQFP package for the LXT971A, LXT972A, and LXT972M Transceivers.

**Figure 1. Example of Pb-Free LQFP Package for Intel® LXT971A, LX972A, and LXT972M Transceivers**

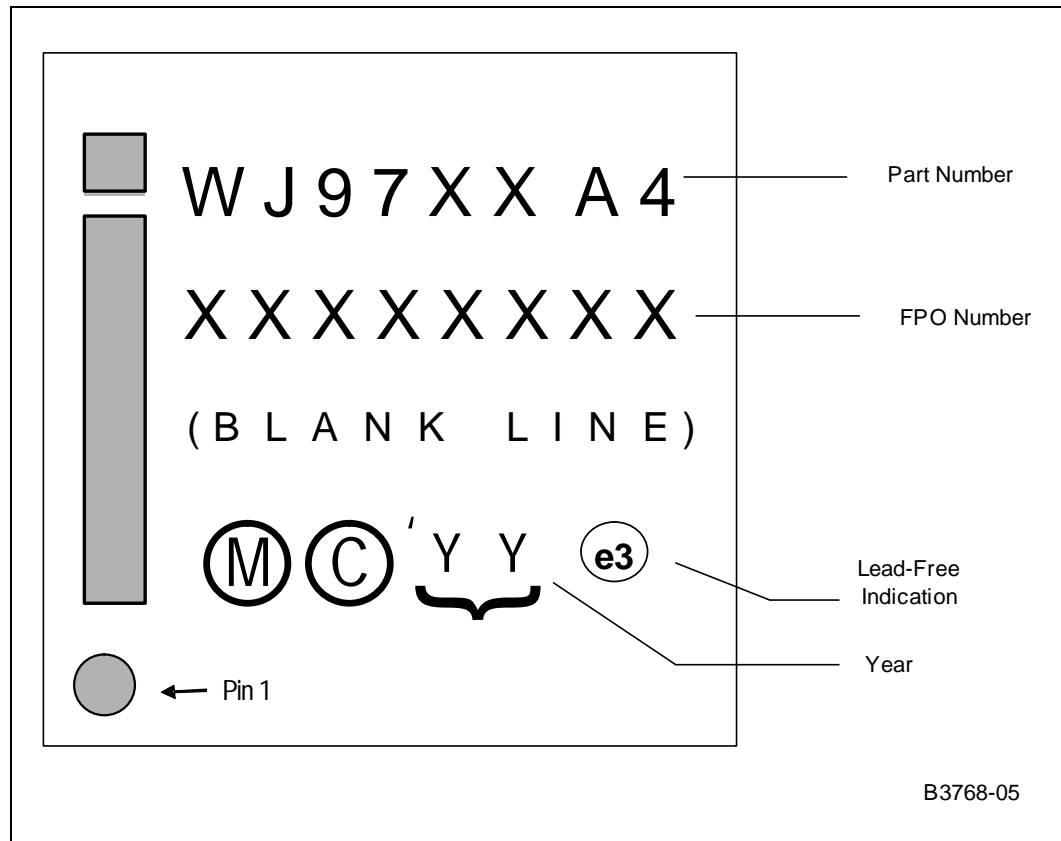

Figure 2 shows a sample LQFP package for the LXT971A, LXT972A, and LXT972M Transceivers.

**Note:** In contrast to the Pb-free LQFP package, the LQFP package does not have the “e3” symbol in the last line of type on the package.

Figure 2. Example of LQFP Package for Intel® LXT971A, LXT972A, and LXT972M Transceivers

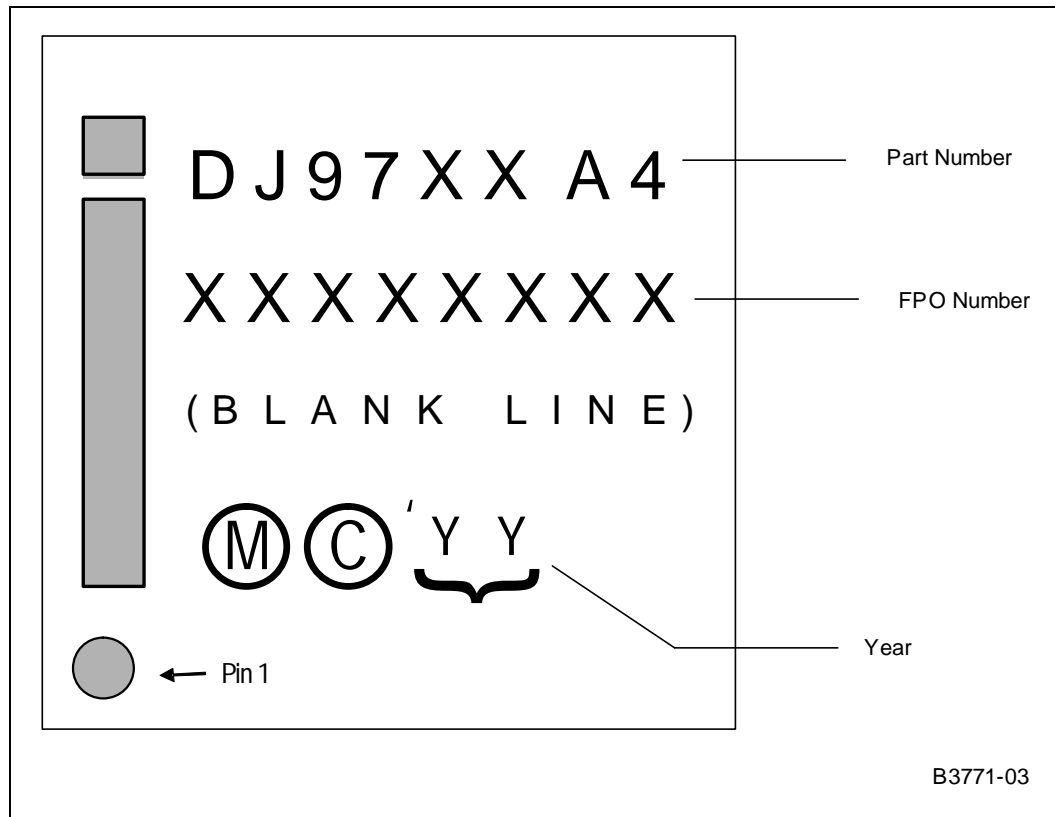

Figure 3 shows the LQFP package for previous revisions of the LXT971A and LXT972A Transceivers.

**Figure 3. Package for Previous Revision of Intel® LXT971A and LXT972A Transceivers**

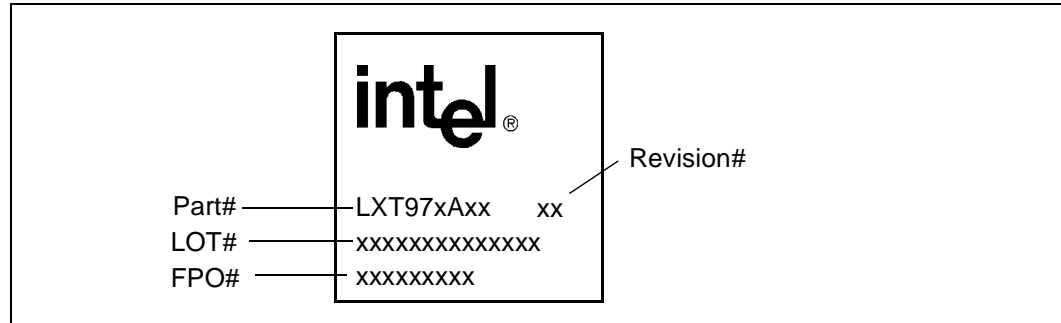

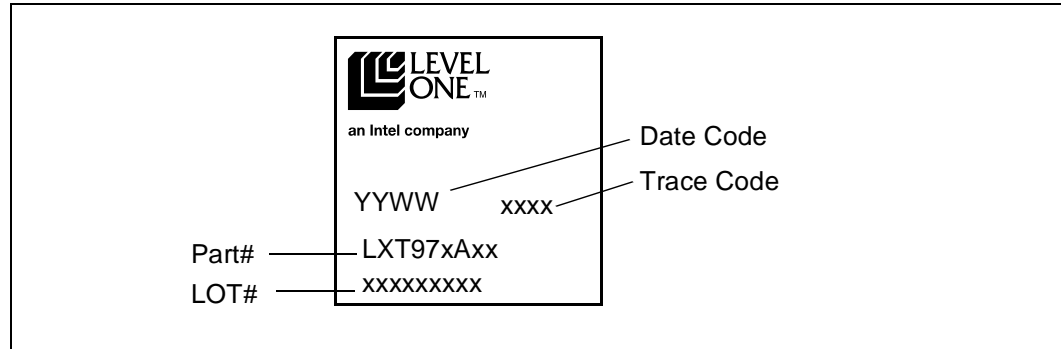

Figure 4 shows the LQFP package for previous revisions of the LXT971A and LXT972A Transceivers. (This figure is for reference only.)

**Figure 4. Package for Level One LXT971A and LXT972A Transceivers (Reference Only)**

In the datasheets for the LXT971A, LXT972A, and LXT972M Transceivers, the silicon stepping is referred to as “Manufacturer’s Revision Number.” Software can read the silicon stepping number from Register bits 3.3:0. Table 1 lists the manufacturer’s revision number, trace codes, and JTAG version IDs for LXT971A, LXT972A, and LXT972M Transceiver steppings.

**Table 1. Revision Numbers, Trace Codes, and JTAG Versions IDs**

Stepping	Revision Number	Trace Codes <sup>1</sup>	Manufacturer’s Revision Number <sup>2</sup>	JTAG Version ID <sup>3</sup>
0	A1	xxAx	0000	0000
1	A2	xxBx	0001	0001
2	A4	xxDx	0010	0010

1. The letter “x” indicates an insignificant variable.  
 2. The value of the revision number is from register bits 3.3:0. For details, see the datasheets for the LXT971A, LXT972A, and LXT972M Transceivers.  
 3. For details on the JTAG version ID, see the Device ID Register tables in the datasheets for the LXT971A, LXT972A, and LXT972M Transceivers.

# Errata

---

## 1. Incorrect Auto-Negotiation Link Partner Base Page Ability Register

**Problem:** Upon completing the parallel detection function, the Auto-Negotiation Link Partner Base Page Ability Register (Register 5) should be updated to reflect the link partner's capability. Register 5 is not updated correctly and always reads 0000h.

**Workaround:** The Status Register #2 (Register 17) is properly updated with the arbitrated link status information and can be used to identify link speed and duplex status.

**Status:** This erratum has been previously fixed.

## 2. Incorrect Auto-Negotiation Next Page

**Problem:** The Auto-Negotiation Next Page state machine functions incorrectly and does not support Next Page operations.

**Workaround:** Bit 4.15 in the Auto-Negotiation Advertisement Register must be set to 0 (port has no ability to send multiple pages).

**Status:** This erratum has been previously fixed.

## 3. Incorrect Remote Fault

**Problem:** In fiber mode, the Remote Fault bit (Register bit 1.4) in MII Status Register #1 is used to report receipt of the Far End Fault Indication (FEFI) code to the MAC. The Remote Fault bit fails to indicate receipt of the FEFI code under certain conditions.

This occurs only when the following conditions are true:

- The device is operating in fiber mode, AND
- The device hardware configuration is set to enable auto-negotiation.

**Workaround:** Strap the LED/CFG1 pin to ground to disable auto-negotiation.

**Status:** This erratum has been previously fixed.

#### 4. Incorrect Auto-Negotiation Duplex Status

**Problem:** The LXT971A and LXT972A Transceivers fail to update the initial control setting for full-duplex or half-duplex operation (Register bit 0.8) after link is established. Under certain conditions, this can cause incorrect reporting of duplex status and collision events. This problem occurs under the following conditions:

- The LXT971A and LXT972A Transceivers are initially set for full-duplex operation, AND
- The LXT971A and LXT972A Transceivers establish a half-duplex link through auto-negotiation or parallel detection

OR

- The LXT971A and LXT972A Transceivers is initially set for half-duplex operation, AND
- The LXT971A and LXT972A Transceivers establish a full-duplex link through auto-negotiation or parallel detection.

**Implication:** In the first case (half-duplex link established while control register is set for full-duplex), the LXT971A and LXT972A Transceivers do the following:

- Function as a full-duplex port
- Indicate full-duplex through LED and Register bit 0.8
- Indicate half-duplex through Register bit 17.9
- Do not indicate collision (through the LED, MII COL signal, or Register bit 17.11) when transmitting and receiving concurrently

In the second case (full-duplex link established while control register is set for half-duplex), the LXT971A and LXT972A Transceivers do the following:

- Function as a half-duplex port
- Indicate half-duplex through the LED
- Indicate full-duplex through Register bit 17.9
- Indicate collision (through LED, MII COL signal, and Register bit 17.11) when transmitting and receiving concurrently

**Workaround:** Set Status Register #2 (Register bit 17.9) to update the duplex status in the Control Register (Address 0). The Status Register #2 (Address 2) is updated with the correct duplex status when auto-negotiation is completed. Each time link is established, the duplex status in Register bit 17.9 can be used to update the duplex mode in the Control Register (Register bit 0.8).

**Status:** This erratum has been previously fixed.

## 5. Incorrect JTAG Revision Code

**Problem:** LXT971A and LXT972A Transceivers (A2) JTAG Device ID is as follows - 0001 03CB 1110 1110 1

As per the standard, the Jedec Continuation Character (Register bit 11:8) for the Intel devices should have been 0000 instead of 1110.

**Implication:** JTAG boundary scan receives an incorrect JTAG ID for the LXT971A and LXT972A Transceivers.

**Workaround:** Use a continuation character of 1110 when addressing an LXT971A Transceiver Stepping 1.

**Status:** This erratum has been previously fixed.

## 6. Incorrect Duplex - Collision LED Display

**Problem:** When the port LED is configured to indicate Duplex and Collision through the LED Configuration Register (Address 20), the LED does not indicate Collision when transmitting and receiving in a half-duplex link.

**Workaround:** Configure a separate LED for Collision only. A dedicated LED properly indicates a collision is occurring.

**Status:** This erratum has been previously fixed.

## 7. Incorrect Activity LED Display

**Problem:** With pulse stretching enabled, port activity is indicated with a slow blinking rate on the activity LED when the port is in full-duplex and the port transmit and receive traffic has the same packet size and inter-packet gap (IPG) for an extended period of time. A correct indication is for the activity LED to remain active when continuously transmitting and receiving.

The activity LED resumes normal operation if either packet size or IPG is altered.

**Implication:** The activity LED indication will not match the traffic rate at the port. Only the Activity LED behavior is affected. Neither transmit nor receive status LED functionality are affected.

The activity LED operation has no impact on data reliability.

**Workaround:** Use the following steps for a possible workaround:

1. Use either transmit or receive status instead of activity as the LED indication.
2. Logically 'OR' transmit status and receive status to generate an activity indicator. This workaround requires external hardware to complete the 'OR' function.
3. Add external pulse stretching through a PLD while disabling on-chip pulse stretching through Register 20 (Register bit 20.1 = 0). This workaround requires external hardware and manageability through the MDIO interface. Also, because pulse stretching is global to the device, external logic must be added for any LED signal that requires stretching.
4. Display both transmit and receive status individually.

**Status:** This erratum has been previously fixed.

## 8. MII Pins Not Three-Stateable

**Problem:** In hardware power-down mode, the receive clock MDINT pins do not go into a high-impedance state or are not three-stated.

**Implication:** In hardware power-down mode, the receive clock (RxClk) and the MDINT pins are continuously driven. The transmit clock will be in a true three-state condition. However, the LXT971A and LXT972A Transceivers continue to source a receive clock.

**Workaround:** None.

**Status:** This erratum has been previously fixed.

## 9. 100 M External Loopback Using Short Cable Length

**Problem:** Link may not occur in applications requiring a short external looping plug (looping TPFO to TPFI) with cable lengths typically less than 2 feet.

**Implication:** During external loopback operations requiring a line-loop length less than two feet, the LXT971A and LXT972A Transceivers input-receiver reference levels may incorrectly slice the twisted-pair signal, causing a loss of link.

**Workaround:** None.

**Status:** This erratum has been previously fixed.

## 10. 10BASE-T Data Inversion

**Problem:** If jitter on the twisted-pair data occurs within a time window relative internally to the DPLL Reference Clock and remains constant, inverted RxData can occur.

**Implication:** When the receive twisted-pair data jitters, the LXT971A and LXT972A Transceivers may pass errored data to the Reconciliation Sublayer. This errored data would be calculated as CRC errors at the MAC and the RXER signal/bit would be active.

**Workaround:** None.

**Status:** This erratum has been previously fixed.

## 11. Power Cycling and JTAG $\overline{\text{TRST}}$ Reset Pin

**Problem:** Power-on cycling may cause the LXT971A and LXT972A Transceivers to hang in an unknown state due to the improper reset of some internal JTAG control flip-flops.

**Implication:** Some internal JTAG flip-flops may not be reset properly, causing the input and output steering muxes to be selected incorrectly. This incorrect selection may disable any of the digital, MII signal outputs and inputs.

**Workaround:** Designs not using JTAG should tie the  $\overline{\text{TRST}}$  pin directly to GND.

Designs using the 5-signal option should tie the  $\overline{\text{TRST}}$  pin to GND through a resistor. The suggested value for this resistor is 20 k $\Omega$ . A 20 k $\Omega$  resistor to GND is strong enough to pull down the internal, weak pull-up to a logic 0 for normal operation. This pull down also allows a JTAG tap controller to operate successfully and overcome the pull-up and pull-down resistors.

Designs using the 4-signal option and not using the  $\overline{\text{TRST}}$  pin for reset should use a 20 k $\Omega$  pull-down resistor from  $\overline{\text{TRST}}$  to GND and control the JTAG  $\overline{\text{TRST}}$  pin, accordingly.

Designs using the LXT971A or LXT972A Transceivers require a new BSDL file that may be found on the Intel website ([www.intel.com](http://www.intel.com)).

**Status:** This erratum has been previously fixed.

## 12. Switching Clocks from 100 Mbps to 10 Mbps Prior to End-of-Packet

**Problem:** Switching clocks from 100 Mbps to 10 Mbps prior to the End-of-Packet (EOP), as the PLL transitions to its reset state, can cause the output to become random and unknown, and result in the corruption of the last nibble of the CRC in the receive packet.

**Implication:** A CRC error occurs randomly on a small percentage of devices and can result in an error rate up to 10 ppm.

**Workaround:** None.

**Status:** This erratum has been previously fixed.

## 13. Changing Advertised Duplex While Link Is Up

**Problem:** Writing to Register bits 4.9:5, which control duplex mode advertisement while link is up and auto-negotiation is enabled, immediately changes the PHY mode of operation to the new duplex mode. When written, the values in this register are not intended to affect PHY operation until a new auto-negotiation cycle is completed.

**Implication:** A possible mixed-duplex operation will exist during the time between Register bits 4.9:5 writes and the start of a new auto-negotiation process.

**Workaround:** Write Register bits 4.9:5 immediately before the start of a new auto-negotiation process.

**Status:** There are no plans to fix this erratum.

## 14. Far-End Fault Reporting

**Problem:** If a link partner continuously sends successive Far-End Fault (FEF) codes (three sets of 84 1s followed by a 0), the LXT971A/LXT972A Transceiver sets the Remote Fault bit High (Register bit 1.4 = 1) and drops link (Register bit 1.2 = 0). Register 1.4 is cleared after a Read and is not set High again while the Far-End Fault signal is present.

**Implication:** Implication: If the MAC reads Register bit 1.4 more than once under a continuous Far-End Fault condition, a Far-End Fault is not indicated after the first Read.

**Workaround:** Once a remote fault has been indicated by Register bit 1.4 = 1, the following sequence can be used to monitor the remote-fault status.

Managed Systems:

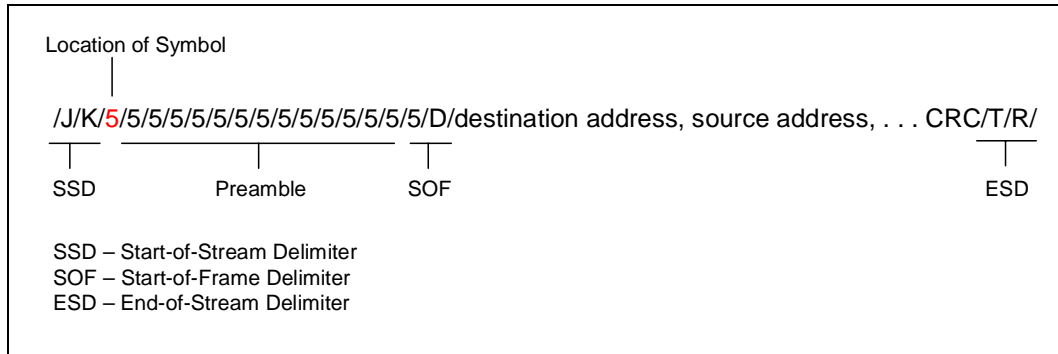

1. Write Register 0 = 0x6100. This forces the port to 100 Mbps full-duplex internal loopback, link is up, Register bit 1.2 = 1, and Register bit 1.4 = 0.
2. Wait approximately 100 mS.
3. Write Register 0 = 0x2100. This forces the port into 100 Mbps full-duplex. If Far-End Fault is present, Register bit 1.4 = 1 indicates Far-End Fault and Register bit 1.2 = 0 indicates link is down.

**Status:** There are no plans to fix this erratum.

### 15. Detection of Illegal Symbols After SSD

**Problem:** An illegal symbol placed immediately after the SSD (preamble after JK) is not detected. However, any subsequent corrupt symbol will be detected.

Standard Frame Contents:

**Implication:** Implication: RXER does not assert if this symbol location is corrupted. However, an error in this location does not affect packet integrity.

**Workaround:** Use the MAC layer protocol to detect corrupt symbols in the packet.

**Status:** There are no plans to fix this erratum.

# Sightings

---

"Sightings" are descriptions of specific device behaviors or interaction behaviors with other devices, originating from a variety of sources internal and external to Intel. Sightings are not device errata, but specific behaviors that may be of interest to customers. Internal sources can include product validation and product test. External sources can include product developers and customers.

## 1. 100BASE-TX Receive Jitter Tolerance

**Description:** If a receive-link partner operating in 100BASE-TX generates transmit jitter greater than the IEEE standard, the LXT971A and LXT972A Transceivers may produce errors within the Reconciliation Sublayer, which can result in a failure to link or to sustain a link. The LXT971A and LXT972A Transceivers needed to be enhanced to allow greater margin to the IEEE standard. The identified change would allow greater design flexibility.

**Note:** Customers are advised that reliance on such an out-of-margin performance is at their own risk.

**Status:** Implemented in Stepping 2.

## 2. 10BASE-T Jitter Tolerance

**Description:** In some 10BASE-T input jitter applications, the LXT971A and LXT972A Transceivers margin may be close to the IEEE standard for input jitter tolerance. The LXT971A and LXT972A Transceivers needed to be enhanced to be optimally centered for 10BASE-T input jitter tolerance. The identified change would allow greater design flexibility; however, customers are advised that reliance on such out-of-margin performance is at their own risk.

**Status:** Implemented in Stepping 2.
