# Photocoupler LTV-50L series

## 1. DESCRIPTION

The LTV-50L series consists of a high efficient AlGaAs Light Emitting Diode and a high speed optical detector. This design provides excellent AC and DC isolation between the input and output sides of the Optocoupler. The output of the optical detector features an open collector Schottky clamped transistor. The internal shield ensures high common mode transient immunity. A guaranteed common mode transient immunity is up to 15KV/ $\mu$ s (min.). The Optocoupler operational parameters are guaranteed over the temperature range from -55°C ~ +100°C.

## NOTES:

- 1) A 0.1 $\mu\text{F}$  or bigger bypass capacitor for  $V_{CC}$  is needed.
- 2)  $260^\circ\text{C}$  for 10 seconds
- 3) Peaking driving circuit may be used to speed up the LED. The peak drive current of LED may go up to 50mA and maximum pulse width 50ns, as long as average current doesn't exceed 20mA.
- 4)  $t_{PLH}$  (propagation delay) is measured from the 3.75 mA point on the falling edge of the input pulse to the 1.5 V point on the rising edge of the output pulse.
- 5)  $t_{PHL}$  (propagation delay) is measured from the 3.75 mA point on the rising edge of the input pulse to the 1.5 V point on the falling edge of the output pulse.
- 6)  $CM_H$  is the maximum tolerable rate of rise of the common mode voltage to assure that the output will remain in a high logic state
- 7)  $CM_L$  is the maximum tolerable rate of fall of the common mode voltage to assure that the output will remain in a low logic state
- 8) Device is considered a two-terminal device: pins 1, 2, 3 shorted together, and pins 4, 5, 6 shorted together.
- 9) In accordance with UL1577, each optocoupler is proof tested by applying an insulation test voltage 6000  $\text{V}_{rms}$  for one second (leakage current less than 10 uA).
