

# USB 2.0 High-Speed, Fault-Tolerant 3:1, 4:1 Multiplexers

## General Description

The MAX4899E/MAX4899AE analog multiplexers combine the low on-capacitance ( $C_{ON}$ ) and low on-resistance ( $R_{ON}$ ) necessary for high-performance switching applications. These devices are designed for USB 2.0 high-speed applications at 480Mbps. The MAX4899E/MAX4899AE also handle all the requirements for USB low- and full-speed signaling.

The MAX4899E is a dual 3:1 multiplexer whereas the MAX4899AE is a dual 4:1 multiplexer. The MAX4899E/MAX4899AE feature two digital inputs,  $C_0$  and  $C_1$ , to control the analog signal path. Typical applications include switching a USB connector between USB and other operations such as serial communications, audio, and video.

An enable input ( $\overline{EN}$ ) is provided to disable all channels and place the device into a high-impedance (off) state, as well as reducing power consumption.

The MAX4899E/MAX4899AE operate from a 2.7V to 3.6V power-supply voltage and are protected against +5.5V shorts to  $COM_A-$  and  $COM_A+$ . In addition,  $COM_A+$  and  $COM_A-$  are normally connected to outside circuitry and feature  $\pm 15kV$  ESD protection. The MAX4899E/MAX4899AE are available in a 3mm x 3mm, 16-pin TQFN package and operate over the  $-40^\circ C$  to  $+85^\circ C$  temperature range.

## Applications

Cell Phones  
Digital Still Cameras  
PDAs  
Digital Video Cameras  
MPEG-4 Players  
Portable GPS  
Combination Products  
KVM

## Features

- ◆ Single 2.7V to 3.6V Power-Supply Voltage
- ◆ Low  $4\Omega$  (typ) On-Resistance ( $R_{ON}$ )
- ◆ -3dB Bandwidth: 425MHz
- ◆ Fault Tolerant to Meet Full USB 2.0 Specification
- ◆  $COM\_$  Protected to  $\pm 15kV$  ESD Protection per Human Body Model (MIL-STD-883; Method 3015)
- ◆ Low Operating Current (200 $\mu A$ ), Ultra-Low Quiescent Current (3.0 $\mu A$  max) in Standby Mode
- ◆ Low Threshold Eliminates the Need for Translators in 1.8V Low Voltage Systems
- ◆ Tiny 16-Pin, 3mm x 3mm, Lead-Free TQFN Package

## Eye Diagram

Pin Configurations appear at end of data sheet.

## Ordering Information/Selector Guide

| PART          | PIN-PACKAGE | MUX CONFIGURATION | TOP MARK | PKG CODE |
|---------------|-------------|-------------------|----------|----------|
| MAX4899EETE+  | 16 TQFN-EP* | DUAL 3:1          | AEY      | T1633-4  |
| MAX4899AEETE+ | 16 TQFN-EP* | DUAL 4:1          | AEZ      | T1633-4  |

Note: All devices are specified over the  $-40^\circ C$  to  $+85^\circ C$  operating temperature range.

+ Denotes lead-free package.

\*EP = Exposed paddle.

**Note 1:** Signals exceeding GND are clamped by internal diodes. Limit forward-diode current to maximum current rating.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS

(V+ = +2.7V to +3.6V, T<sub>A</sub> = -40°C to +85°C,  $\overline{QP}$  = low,  $\overline{EN}$  = low, unless otherwise noted. Typical values are at V+ = +3.3V and T<sub>A</sub> = +25°C.) (Note 2)

## Detailed Description

The MAX4899E/MAX4899AE analog multiplexers combine the low on-capacitance ( $C_{ON}$ ) and low on-resistance ( $R_{ON}$ ) necessary for high-performance switching applications. These devices are designed for USB 2.0 high-speed applications at 480Mbps. The MAX4899E/MAX4899AE also handle all the requirements for USB low- and full-speed signaling. In the case of USB low/full speed, these devices can function normally even if the supply voltage is 2.7V, even though the USB signal may be higher than the supply voltage.

The MAX4899E is a dual 3:1 multiplexer, whereas the MAX4899AE is a dual 4:1 multiplexer. The MAX4899E/MAX4899AE feature two digital inputs,  $C_0$  and  $C_1$ , to control the analog signal path. Typical applications include switching a USB connector between USB and other operations such as serial communications, audio, and video.

An enable input ( $\overline{EN}$ ) is provided to disable all channels and place the device into a high-impedance (off) state, as well as shutting off the charge pump for minimum power consumption. The MAX4899E/MAX4899AE feature an additional charge-pump enable input ( $\overline{QP}$ ) to disable the charge pump. The switches remain active at a lower analog signal range and higher  $R_{ON}$ .

The MAX4899E/MAX4899AE operate from a 2.7V to 3.6V power-supply voltage and are current-limit protected against +5.5V shorts to  $COM_{A-}$  and  $COM_{A+}$ .

### Digital Control Inputs ( $C_0$ , $C_1$ )

The MAX4899E/MAX4899AE provide two digital control inputs ( $C_0$ ,  $C_1$ ) to select the analog signal path between the  $COM_{A-}$  and  $USB_{-}$  channels. The truth tables for the MAX4899E/MAX4899AE are shown in the *Functional Diagrams*. Since the MAX4899E only has three  $USB_{-}$  channels, the code  $C_1:C_0 = 1:1$  can be used to place all channels into a high-impedance state. This is particularly useful for eliminating the extra control line to the  $\overline{EN}$  input that is normally used for disabling all channels. Driving  $C_0$  and  $C_1$  rail-to-rail minimizes power consumption.

### Enable Input ( $\overline{EN}$ )

The MAX4899E/MAX4899AE feature an enable input ( $\overline{EN}$ ) that when driven high places all channels into a high-impedance state, as an all-off feature. The internal charge pump is also disabled when  $\overline{EN}$  is high, thus minimizing the quiescent supply current. For normal operation, drive  $\overline{EN}$  low.

### Charge-Pump Enable Input ( $\overline{QP}$ )

The charge-pump input ( $\overline{QP}$ ) disables and enables the internal charge pump. Drive  $\overline{QP}$  high to disable the charge pump and reduce the quiescent supply current.

With the charge pump disabled, the MAX4899E/MAX4899AE still function normally; however, the analog signal range is reduced and the switch on-resistance ( $R_{ON}$ ) is increased. The analog signal range with the charge pump disabled is 0V to 1.5V. For normal operation, drive  $\overline{QP}$  low.

## Analog Signal Levels

Signals applied to  $COM_{A+}$  are routed to the  $USB_{+}$  terminals, and signals applied to  $COM_{A-}$  are routed to the  $USB_{-}$  terminals. These multiplexers are bidirectional, allowing  $COM_{A-}$  and  $USB_{-}$  to be configured as either inputs or outputs. The D+ and D- notation in the *Pin Description* table is arbitrary and can be interchanged. For example, USB D+ signals can be applied to  $COM_{A-}$  and are routed to the  $USB_{-}$  terminals. Additionally, these multiplexers can be used for non-USB signals.  $COM_{A+}$  and  $COM_{A-}$  are normally connected to outside circuitry and are  $\pm 15$ kV ESD protected.

The MAX4899E is a dual 3:1 multiplexer, allowing  $COM_{A+}$  to be routed to one of three  $USB_{+}$  channels, and  $COM_{A-}$  to be routed to one of three  $USB_{-}$  channels. The MAX4899AE is a dual 4:1 multiplexer, allowing  $COM_{A+}$  to be routed to one of four  $USB_{+}$  channels, and  $COM_{A-}$  to be routed to one of four  $USB_{-}$  channels.

## Overvoltage Fault Protection

The MAX4899E/MAX4899AE feature +5.5V fault protection to  $COM_{A+}$  and  $COM_{A-}$ . When a fault occurs between 4.5V to 5.5V, the switch automatically goes into a current-limiting mode that limits current to less than 2mA. Fault protection prevents these switches and downstream devices from being damaged due to shorts to the USB bus voltage rail.

## Applications Information

### USB Switching

The MAX4899E/MAX4899AE analog multiplexers are fully compliant with the USB 2.0 specification. The low on-resistance and low on-capacitance of these multiplexers make them ideal for high-performance switching applications. The MAX4899E/MAX4899AE are ideal for routing USB data lines and for applications that require switching between different data types (see Figure 8).

### Board Layout

High-speed switches require proper layout and design procedures for optimum performance. Keep design-controlled impedance PC board traces as short as possible. Ensure that bypass capacitors are placed as close to the device as possible and use large ground planes where possible.

# USB 2.0 High-Speed, Fault-Tolerant 3:1, 4:1 Multiplexers

Figure 8. MAX4899AE Multiplexing Four Data Types

## ESD Protection

As with all Maxim devices, ESD-protection structures are incorporated on all pins to protect against electrostatic discharges encountered during handling and assembly. The COMA+ and COMA- lines have extra protection against static electricity. Maxim's engineers have developed state-of-the-art structures to protect these pins against ESD of  $\pm 15\text{kV}$  without damage. The ESD structures withstand high ESD in all states: normal operation, tri-state output mode, and powered down. After an ESD event, Maxim's E-versions keep working without latch-up, whereas competing products can latch and must be powered down to remove latch-up.

## Human Body Model

The MAX4899E/MAX4899AE COMA+ and COMA- pins are characterized for  $\pm 15\text{kV}$  ESD protection using the Human Body Model (MIL-STD-883, Method 3015). Figure 9a shows the Human Body Model and Figure 9b shows the current waveform it generates when discharged into a low impedance. This model consists of a  $100\text{pF}$  capacitor charged to the ESD voltage of interest, which is then discharged into the device through a  $1.5\text{k}\Omega$  resistor.
