

MP6631H

35V Input, 3A Peak Phase Current, Three-Phase BLDC Motor Driver

DESCRIPTION

The MP6631H is a three-phase brushless DC (BLDC) motor driver with integrated power MOSFETs. The device supports a single external Hall sensor or triple external Hall-effect sensors to drive a three-phase BLDC motor, with up to 3A of peak phase current and an input voltage (V_{IN}) range of 3.6V to 35V.

The MP6631H controls the motor speed through the pulse-width modulation (PWM) signal or the DC signal on the PWM/DC pin with closed-/open-loop control. The device features a built-in, configurable speed curve function. It also features a sinusoidal drive for maximum torque, as well as low speed ripple and noise across the full speed range.

The MP6631H provides rotational speed detection. The rotational speed detector (the FG/RD pin) is an open-drain output. It outputs a high or low voltage relative to the Hall comparator's output. Direction control is achieved via the DIR pin's input.

Rich protection features include input over-voltage protection (OVP), under-voltage lockout (UVLO), locked-rotor protection, over-current protection (OCP), and thermal shutdown protection.

The MP6631H is available in a QFN-26 (3mmx4mm) package.

FEATURES

- 3.6V to 35V Operating Input Voltage (V_{IN}) Range
- Up to 3A of Peak Phase Current
- Integrated 160m Ω High-Side MOSFETs (HS-FETs) and Low-Side MOSFETs (LS-FETs)
- Sinusoidal Drive
- Supports 0V to 1.2V DC Input or 1kHz to 100kHz Pulse-Width Modulation (PWM) Input
- Supports Triple-Hall or Single-Hall Element Differential Input
- Closed-/Open-Loop Speed Control
- Direction/Brake Input
- Power-Save Mode
- 0.5s/4.5s Lock Protection
- Over-Current Protection (OCP)
- Single-Pulse or Triple-Pulse FG Output per Electrical Cycle
- FG Signal: Rotational Speed Indication
- Soft Start (SS) for Low Noise and Current Overshoot
- Available in a QFN-26 (3mmx4mm) Package

APPLICATIONS

- Fans
- General Three-Phase Brushless DC (BLDC) Motors
- Pumps

All MPS parts are lead-free, halogen-free, and adhere to the RoHS directive. For MPS green status, please visit the MPS website under Quality Assurance. "MPS", the MPS logo, and "Simple, Easy Solutions" are trademarks of Monolithic Power Systems, Inc. or its subsidiaries.

ORDERING INFORMATION

Part Number*	Package	Top Marking	MSL Level
MP6631HGL-xxxx**	QFN-26 (3mmx4mm)	See Below	1

* For Tape & Reel, add suffix -Z (e.g. MP6631HGL-xxxx-Z).

** "-xxxx" is the configuration code identifier. The first four digits of the suffix (-xxxx) can be a hexadecimal value between 0 and F. Work with an MPS FAE to create this unique number for non-default function option. -0000 is the default function value.

 LLL: Lot number

PACKAGE REFERENCE

PIN FUNCTIONS

Pin #	Name	Description
1	FG/RD	Speed or rotor lock indication. Open-drain output. FG/RD can be used for speed indication (FG) or rotor lock indication (RD). Pull up this pin externally.
2, 19,	OUTC	Phase C terminal.
3, 5	PGND	Power ground.
4, 17	OUTB	Phase B terminal.
6, 15	OUTA	Phase A terminal.
7	HA+	Phase A positive Hall input terminal.
9	HA-	Phase A negative Hall input terminal.
10	HB+	Phase B positive Hall input terminal.
11	HB-	Phase B negative Hall input terminal.
12	HC+	Phase C positive Hall input terminal.
14	HC-	Phase C negative Hall input terminal.
16, 18	VCC	Input voltage supply pin. The VCC pin must be locally bypassed.
20	PWM/DC	Rotational speed control input pin. Pull the PWM/DC pin high internally with 500kΩ resistance. When DC_PWM = 0, apply a 1kHz to 100kHz pulse-width modulation (PWM) signal for speed control. When DC_PWM = 1, apply a 0V to 1.2V DC voltage for speed control.
22	REF	5V LDO output. The REF pin must be locally bypassed.
23	AGND	Analog ground.
24	DIR	Direction control pin. Pull this pin low for forward rotation (A → B → C); pull it high for reverse rotation (A → C → B). Internally pull down using a resistor.
25	BRK	Brake pin. Pull BRK high to brake the motor, pull it low internally using a resistor.
8, 13, 21, 26	NC	

ABSOLUTE MAXIMUM RATINGS ⁽¹⁾

V _{CC}	-0.3V to +38V
OUTA, OUTB, OUTC	-0.3V to V _{CC} + 0.3V
All other pins	-0.3V to +5.8V
Junction temperature	150°C
Lead temperature	260°C
Continuous power dissipation (T _A = 25°C) ⁽²⁾	2.6W
Junction temperature	150°C
Storage temperature	-60°C to +150°C

ESD Ratings

Human body model (HBM)	2kV
Charged device model (CDM)	2kV

Recommended Operating Conditions ⁽³⁾

Supply voltage (V _{CC})	3.6V to 35V
Operating junction temp (T _J)	-40°C to +125°C

Thermal Resistance ⁽⁴⁾	θ_{JA}	θ_{JC}
QFN-26 (3mmx4mm)	48	11... °C/W

Notes:

- Exceeding these ratings may damage the device.
- The maximum allowable power dissipation is a function of the maximum junction temperature, T_J (MAX), the junction-to-ambient thermal resistance, θ_{JA}, and the ambient temperature, T_A. The maximum allowable continuous power dissipation at any ambient temperature is calculated by P_D (MAX) = (T_J (MAX) - T_A) / θ_{JA}. Exceeding the maximum allowable power dissipation can produce an excessive die temperature, which may cause the regulator to go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage.
- The device is not guaranteed to function outside of its operating conditions.
- Measured on JESD51-7, 4-layer PCB.

ELECTRICAL CHARACTERISTICS

$V_{CC} = 12V$, $T_J = -40^{\circ}C$ to $+125^{\circ}C$, unless otherwise noted.

Parameter	Symbol	Condition	Min	Typ	Max	Units
Input under-voltage lockout (UVLO) rising threshold	V_{UVLO}		3	3.3	3.5	V
Input UVLO hysteresis				360		mV
Operating supply current	I_{CC}			6.7		mA
Standby current	$I_{STANDYBY}$			130		μA
DIR input high voltage	V_{DIR_H}		1.5			V
DIR input low voltage	V_{DIR_L}				0.4	V

TYPICAL PERFORMANCE CHARACTERISTICS

Performance waveforms are tested on the evaluation board. $V_{IN} = 12V$, PWM frequency = 20kHz, with a single external Hall-effect sensor or triple external Hall-effect sensors.

Steady State

PWM duty = 100%, DIR = low, CCW

Steady State

PWM duty = 50%, DIR = low, CCW

Steady State

PWM duty = 100%, DIR = high, CW

Steady State

PWM duty = 50%, DIR = high, CW

PWM On

PWM duty = 0% to 100%, triple Hall-effect sensor, DIR = low, CCW

PWM On

PWM duty = 0% to 100%, triple Hall-effect sensor, DIR = high, CW

TYPICAL PERFORMANCE CHARACTERISTICS *(continued)*

Performance waveforms are tested on the evaluation board. $V_{IN} = 12V$, PWM frequency = 20kHz, with a single external Hall-effect sensor or triple external Hall-effect sensors.

PWM On

PWM duty = 0% to 100%, single Hall sensor, DIR = low, CCW

PWM On

PWM duty = 0% to 100%, single Hall sensor, DIR = low, CCW

PWM On

PWM duty = 0% to 100%, single Hall sensor, DIR = high, CW

PWM On

PWM duty = 0% to 100%, single Hall sensor, DIR = high, CW

PWM Off

PWM duty = 100% to 0%, DIR = low, CCW

PWM Off

PWM duty = 100% to 0%, DIR = high, CW

TYPICAL PERFORMANCE CHARACTERISTICS *(continued)*

Performance waveforms are tested on the evaluation board. $V_{IN} = 12V$, PWM frequency = 20kHz, with a single external Hall-effect sensor or triple external Hall-effect sensors.

Start-Up with VCC

$V_{CC} = 0V$ to 12V, PWM duty = 100%, single Hall sensor, DIR = low, CCW

Start-Up with VCC

$V_{CC} = 0V$ to 12V, PWM duty = 100%, triple Hall sensor, DIR = low, CCW

Shutdown with VCC

$V_{CC} = 0V$ to 12V, PWM duty = 100%, DIR = low, CCW

Rotor Lock and Retry

PWM duty = 25%, triple Hall sensor, lock rotor then release

Rotor Lock and Retry

PWM duty = 25%, single Hall sensor, lock rotor then release

FUNCTIONAL BLOCK DIAGRAM

Figure 3: Functional Block Diagram

OPERATION

The MP6631H is a three-phase brushless DC (BLDC) motor driver with integrated power MOSFETs. The MP6631H controls the motor speed via the pulse-width modulation (PWM) signal or the DC voltage on the PWM/DC pin, with closed/open-loop speed control and a built-in, configurable speed curve function.

The MP6631H also features a rotational speed detector. The rotational speed detector (the FG/RD pin) is an open-drain output. It outputs a high or low voltage relative to the external Hall signal. Additionally, direction control is achieved via the DIR pin's input, and the BRK pin is used to brake the motor.

Rich protection features include input over-voltage protection (OVP), under-voltage lockout (UVLO), locked-rotor protection, over-current protection (OCP), and thermal shutdown protection.

A sinusoidal drive is employed in the MP6631H. Figure 4 shows the MP6631H's output drive, where HA, HB, and HC are the output of Hall A, Hall B, and Hall C, respectively. OUTA, OUTB, and OUTC are the output duty of the OUTA, OUTB, and OUTC pins, respectively.

Figure 4: MP6631H Hall Output and Output Drive

Speed Control

The PWM/DC pin controls the motor speed in an open loop or closed loop via the PWM signal or the DC voltage. PWM/DC accepts a wide input frequency range (1kHz to 100kHz) or a 0V to 1.2V voltage.

If DC_PWM = 1, then the motor speed is controlled via the DC voltage on the PWM/DC pin.

If DC_PWM = 0, then the motor speed is controlled via the input PWM signal duty cycle.

Starting Duty and Minimum Speed

The starting duty is configured by the DIN_MIN bits. When PWM input duty is below the duty set by DIN_MIN, the fan speed supports two modes:

1. The speed maintains the minimum speed when SPD_ZERO is set to 0.
2. The speed is at 0 when SPD_ZERO is set to 1.

Speed Curve Configuration

The SPD_MAX registers configure the speed when the input duty is at 100%. Otherwise, the MP6631H provides a five-point curve configuration function where the output speed can be configured when the input duty is 37.5%, 50%, 62.5%, 75%, or 87.5%. Linear interpolation occurs between the adjacent duty cycles.

The DIN_MIN register sets the minimum input duty, and SPD_MIN sets the minimum output duty and minimum speed.

Figure 5 shows the curve configuration when SPD_ZERO = 1.

Figure 5: Curve Configuration when SPD_ZERO = 1

Figure 6 shows the curve configuration when SPD_ZERO = 0.

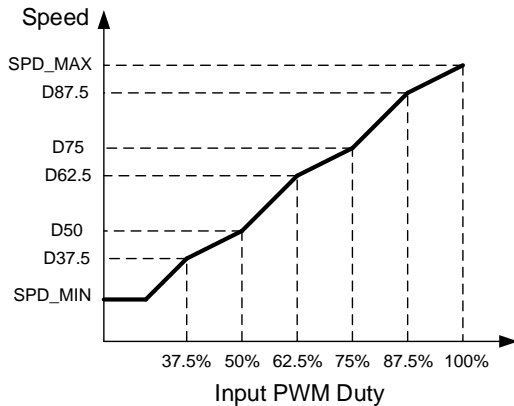

Figure 6: Curve Configuration when SPD_ZERO = 0

Speed Open-/Closed-Loop Control

In closed-loop mode (OPEN_L = 0, CLOSE_H = 1), the MP6631H internally detects the Hall signal speed and feedback to the control loop, which adjusts the output PWM duty in a closed loop. By doing this, the motor speed follows the reference exactly.

In open-loop mode (OPEN_L = 1), the OUT1 and OUT2 output duty cycles directly depend on the PWM input duty.

In mixed mode (OPEN_L = 0, CLOSE_H = 0), the MP6631H operates in closed-loop mode when the PWM input duty is below 87.5%, and operates in open-loop mode when input duty exceeds 87.5%.

Soft-Start Time

To reduce the input inrush current during start-up, the MP6631H provides the reference speed's configurable soft-start time (t_{SS}) by setting register bits TDYN[1:0]. This time can be configured from 1.3s to 10.4s.

Closed-Loop Integrator Gain

In closed-loop mode, the closed-loop integrator gain depends on registers KI[7:0] and KP[7:0].

Higher KI and KP values lead to quick loop response. KI and KP should be adjusted according to the dynamic response and steady state operation.

Single- or Triple-Hall Input Mode

The MP6631H supports either a single or triple Hall-effect sensor. If a single Hall-effect sensor is employed, the Hall selecting bit must set the single Hall sensor, and Hall C is used as the control.

Direction Control

The direction is controlled by the DIR pin's polarity. When DIR is pulled low, the MP6631H operates in forward rotation in the following sequence: A → B → C → A...

When DIR is pulled high, the MP6631H operates in reverse rotation in the following sequence: A → C → B → A...

Alignment

At the beginning of start-up in single Hall sensor applications, the MP6631H aligns the rotor in certain positions depending on the Hall outputs. After the alignment time set by register TOPS completes, the MP6631H enters pre-startup. This function is only enabled in single Hall sensor applications.

Pre-Startup Timer

During pre-startup, the MP6631H gradually increases the output duty cycle with the timer set by the TPRES[1:0] bits. This provides sufficient torque for robust start-up and avoids current overshoot during start-up.

- TPRES = 0: Timer period is 2.5ms
- TPRES = 1: Timer period is 5ms
- TPRES = 2: Timer period is 10ms
- TPRES = 3: Timer period is 20ms

A higher timer period leads to lower soft pre-startup current, but increases pre-startup time.

Cycle-by-Cycle Over-Current Protection (OCP)

During normal switching, if the current flowing through the MOSFET exceeds the threshold set by register bits OCP[1:0] after a set blanking time, then the high-side MOSFETs (HS-FETs) turn off and the low-side MOSFETs (LS-FETs) turn on immediately. The MP6631H resumes normal switching during the next switching cycle.

Maximum Peak Current Limit

If the load current is not limited by OCP and the current exceeds the maximum peak current limit threshold (typically 6A), all MOSFETs turn off and the MP6631H tries to re-enable after a lock-retry time.

Speed Detection

The FG signal on the FG/RD pin outputs an internal Hall change signal for speed indication. Different FG signal frequencies are provided. The frequencies are selected by setting the FGRD bit to 00, 01, or 10.

FG/RD is an open-drain output, and must be pulled up externally by a resistor.

Locked-Rotor Protection

If the motor rotor is locked and the Hall signal edge is not detected during the 0.5s detection time, then the MP6631H turns on all LS-FETs and auto-restarts after the recovery time (4.5s). By setting the FGRD bit to 11, the signal on FG/RD is set to rotor lock indication. During locked-rotor fault status, FG/RD remains low.

Over-Voltage Protection (OVP)

If the voltage on the VCC pin (V_{CC}) exceeds the over-voltage (OV) threshold (34V), the

MP6631H turns off the HS-FETs and turns on the LS-FETs. Once V_{CC} drops below 32V, the device resumes normal operation.

Thermal Shutdown

The MP6631H also provides thermal monitoring. If the MP6631H's die temperature exceeds 160°C, then the output duty decreases to reduce power consumption until the die temperature drops below 135°C.

Under-Voltage Lockout (UVLO)

If the voltage on the VCC pin (V_{CC}) falls below the UVLO threshold, all circuitry in the device is disabled and the internal logic is reset. Once V_{CC} exceeds the UVLO threshold, the device resumes normal operation.

Test Mode and Factory Mode

To configure the internal registers, the MP6631H supports test mode. In test mode, all internal registers can be read/written. After the design is finalized, the register value can be configured to the non-volatile memory (NVM), which can be configured twice. Refer to the MPS Fan Driver GUI Software for easy parameter changes and memory configuration.

APPLICATION INFORMATION

Selecting the Input Capacitor

Place an input capacitor (C_{IN}) as close to the VCC and GND pins as possible. A sufficient capacitance must be applied to maintain a stable input voltage (V_{IN}) and reduces input switching voltage noise and ripple. C_{IN} 's impedance must be low at the switching frequency (f_{sw}). Ceramic capacitors with X7R dielectrics are recommended for their low ESR characteristics.

The capacitance depends on the DC voltage applied on the capacitor. A ceramic capacitor can lose more than 50% of its capacitance when the voltage is close to the voltage rating. Leave a sufficient voltage rating margin when selecting the capacitor.

It is recommended to use an additional electrolytic capacitor to absorb chargeback energy.

Input Clamping TVS

High voltage spikes are created when the energy stored in the motor charges back to C_{IN} . To avoid these spikes, a voltage-clamping transient voltage suppressor (TVS) diode is recommended. The maximum clamping voltage should be below the MP6631H's maximum operating V_{IN} .

Hall Placement and Connection

Hall sensors are required to operate the MP6631H, which supports Hall elements with differential inputs. When Hall elements are used, the Hall sensors can be connected in series or in parallel.

Figure 7 shows the Hall sensors connected in series.

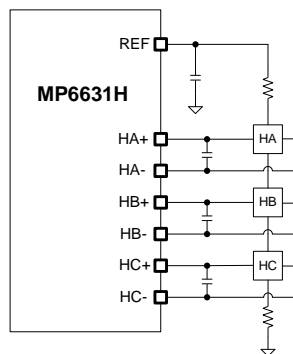

Figure 7: Series Hall Elements Connection

Figure 8 shows the Hall sensors connected in parallel.

Figure 8: Parallel Hall Elements Connection

The MP6631H's Hall-sensor IC outputs logic polarity with an open-drain output, and requires an external pull-up resistor.

Figure 9 shows the Hall-sensor IC connection.

Figure 9: Hall Sensor Connection

Hall Sensor Placement Example

The MP6631H supports either a single or triple Hall-effect sensor. Consider the Hall sensor placement for a 4-pole, 6-slot motor. There are two conditions to evaluate:

1. When the current flows into the stator phase winding, the north magnetic field is generated.
2. If the Hall sensor output is high when the north pole is close to the Hall sensor's branded side.

If both conditions are satisfied, then the Hall sensor placement is as follows (see Figure 10):

- Hall A is aligned with phase B's central line.
- Hall B is aligned with phase C's central line.
- Hall C is aligned with phase A's central line. In single Hall sensor applications, Hall C is the active Hall sensor.

Figure 10: Hall Sensor Placement Option 1

If one of these conditions is not satisfied, then the Hall sensor placement can be shifted 180° into an electrical angle, resulting in the following Hall sensor placement (see Figure 11):

- Hall A is aligned with the central line of phase A and phase C.
- Hall B is aligned with the central line of phase A and phase B.
- Hall C is aligned with the central line of Phase B and Phase C.

Figure 11: Hall Sensor Placement Option 2
PCB Layout Guidelines

Efficient PCB layout is critical for stable operation. For the best results, refer to Figure 12 and Figure 13, and follow the guidelines below:

1. After selecting C_{IN} , place a 100nF/X7R bypass capacitor as close to the VCC and GND pins as possible.
2. Figure 12 shows the recommended PCB layout when the MP6631H is placed on the top layer and the bypass capacitor is placed on the bottom layer.

Figure 12: Recommended PCB Layout (Top View)

3. Figure 13 shows the side view of the MP6631H's recommended PCB layout.

RECOMMENDED LAND PATTERN

NOTE:

- 1) ALL DIMENSIONS ARE IN MILLIMETERS.
- 2) LEAD COPLANARITY SHALL BE 0.08 MILLIMETERS MAX.
- 3) JEDEC REFERENCE IS MO-220.
- 4) DRAWING IS NOT TO SCALE.

CARRIER INFORMATION

Part Number	Package Description	Quantity/ Reel	Quantity/ Tube	Quantity/ Tray	Reel Diameter	Carrier Tape Width	Carrier Tape Pitch
MP6631HGL-xxxx-Z	QFN-26 (3mmx4mm)	5000	N/A	N/A	13in	12mm	8mm

REVISION HISTORY

Revision #	Revision Date	Description	Pages Updated
1.0	2/17/2022	Initial Release	-
1.1	2/21/2023	Updated the Hall input low voltage, common mode parameter's maximum value to "1.06"; updated the Hall input high voltage, common mode parameter's minimum value to "4.43"; updated the Hall input minimum differential voltage parameter's name, symbol, conditions, and values	5
