

EVQ4576-QB-00A

60V, 0.6A, High-Efficiency, Synchronous Buck Converter Evaluation Board, AEC-Q100

DESCRIPTION

The EVQ4576-QB-00A is an evaluation board designed to demonstrate the capabilities of the MPQ4576/MPQ4576-AEC1, a fully integrated, fixed-frequency, synchronous step-down converter. It can achieve up to 0.6A of continuous output current (I_{OUT}) with peak current control for excellent transient response.

Advanced asynchronous modulation (AAM) mode achieves high efficiency under light-load conditions by scaling down the frequency to reduce switching and gate driver losses.

The EVQ4576-QB-00A is a fully assembled and tested evaluation board that generates up to 5V of output voltage (V_{OUT}) and up to 0.6A of load current from a wide 5V to 60V input voltage range.

The MPQ4576 is available in a QFN-12 (2.5mmx3mm) package.

QUICK START GUIDE

1. Preset the power supply between 5V and 60V. Be aware that electronic loads represent a negative impedance to the converter, which can trigger hiccup mode if the current exceeds 1.7A.
2. Turn off the power supply. If longer cables (>0.5m total) are being used between the source and the evaluation board, install a damping capacitor at the input terminals. This is critical when V_{IN} exceeds 24V.
3. Connect the power supply terminals to:
 - a. Positive (+): VEMI
 - b. Negative (-): GND
4. Connect the load terminals to:
 - a. Positive (+): VOUT
 - b. Negative (-): GND
5. After making the connections, turn on the power supply. The board should start up automatically.
6. To use the enable (EN) function, apply a digital input to the EN pin. Drive EN above 1.45V to turn the converter on; drive EN below 1.12V to turn it off.
7. An external frequency resistor (R_{FREQ}) sets the switching frequency (f_{SW}). R_{FREQ} can be estimated with Equation (1):

$$R_{FREQ} (M\Omega) = \frac{30}{f_{SW} (kHz)} \quad (1)$$

A bench test may be required to fine-tune the calculated resistance.

8. An external feedback resistor divider ($R6 + R4$) sets the output voltage (V_{OUT}). $R6 + R4$ also sets the loop bandwidth via an internal compensation capacitor. Choose $R4$ to be about 40k Ω . Then $R5$ can be calculated with Equation (2):

$$R5 = \frac{R4}{\frac{V_{OUT}}{0.8} - 1} \quad (2)$$

Figure 1 shows the feedback resistor network.

Figure 1: Feedback Resistor Network

Table 1 lists the recommended feedback resistor values for common output voltages.

Table 1: Recommended Resistor Values

V_{OUT} (V)	R4 (kΩ)	R5 (kΩ)	R6 (kΩ)
3.3	41.2 (1%)	13 (1%)	20 (1%)
5	41.2 (1%)	7.68 (1%)	20 (1%)
12	41.2 (1%)	2.94 (1%)	20 (1%)

9. Jumper points JP3 and JP4 can be used for external shielding above the inductor and IC. JP3 and JP4 are not stuffed by default.
