Low-Voltage CMOS Octal **Transceiver/Registered** Transceiver

With 5 V–Tolerant Inputs and Outputs (3-State, Non-Inverting)

The MC74LCX646 is a high performance, non-inverting octal transceiver/registered transceiver operating from a 2.3 to 3.6 V supply. High impedance TTL compatible inputs significantly reduce current loading to input drivers while TTL compatible outputs offer improved switching noise performance. A V_I specification of 5.5 V allows MC74LCX646 inputs to be safely driven from 5 V devices. The MC74LCX646 is suitable for memory address driving and all TTL level bus oriented transceiver applications.

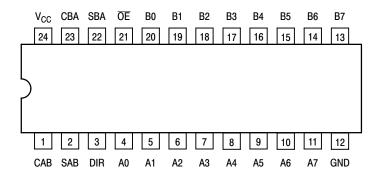

Data on the A or B bus will be clocked into the registers as the appropriate clock pin goes from a LOW-to-HIGH logic level. Output Enable (\overline{OE}) and DIR pins are provided to control the transceiver outputs. In the transceiver mode, data present at the high impedance port may be stored in either the A or the B register or in both. The select controls (SBA, SAB) can multiplex stored and real-time (transparent mode) data. The direction control (DIR) determines which bus will receive data when the enable \overline{OE} is active LOW. In the isolation mode (OE HIGH), A data may be stored in the B register or B JE FO data may be stored in the A register. Only one of the two buses, A or B, may be driven at one time.

- Designed for 2.3 to 3.6 V V_{CC} Operation
- 5 V Tolerant Interface Capability With 5 V TTL Logic
- Supports Live Insertion and Withdrawal
- IOFF Specification Guarantees High Impedance When
- LVTTL Compatible
- LVCMOS Compatible
- 24 mA Balanced Output Sink and Source Capability
- Near Zero Static Supply Current in All Three Logic States (10 μA) Substantially Reduces System Power Requirements
- Latchup Performance Exceeds 500 mA
- ESD Performance: Human Body Model >2000 V; Machine Model >200 V
