## MJF15030 (NPN), MJF15031 (PNP)

## Complementary Power Transistors <br> For Isolated Package Applications

Designed for general-purpose amplifier and switching applications, where the mounting surface of the device is required to be electrically isolated from the heatsink or chassis.

## Features

- Electrically Similar to the Popular MJE15030 and MJE15031
- No Isolating Washers Required, Reduced System Cost
- High Current Gain-Bandwidth Product
- UL Recognized, File \#E69369, to 3500 V RMS Isolation
- These Devices are $\mathrm{Pb}-$ Free and are RoHS Compliant*

Figure 3. Reverse Bias Switching Safe Operating Area

Figure 5. Small-Signal Current Gain

There are two limitations on the power handling ability of a transistor: average junction temperature and second breakdown. Safe operating area curves indicate $I_{C}-V_{C E}$ limits of the transistor that must be observed for reliable operation, i.e., the transistor must not be subjected to greater dissipation than the curves indicate.

The data of Figures 2 and 3 is based on $\mathrm{T}_{\mathrm{J}(\mathrm{pk})}=150^{\circ} \mathrm{C}$; $\mathrm{T}_{\mathrm{C}}$ is variable depending on conditions. Second breakdown pulse limits are valid for duty cycles to $10 \%$ provided $\mathrm{T}_{\mathrm{J}(\mathrm{pk})}$ $<150^{\circ} \mathrm{C}$. $\mathrm{T}_{\mathrm{J}(\mathrm{pk})}$ may be calculated from the data in Figure 1. At high case temperatures, thermal limitations will reduce the power that can be handled to values less than the limitations imposed by second breakdown.

MOUNTING INFORMATION

Figure 12. Typical Mounting Techniques*

#### Abstract

Laboratory tests on a limited number of samples indicate, when using the screw and compression washer mounting technique, a screw torque of 6 to $8 \mathrm{in} \cdot \mathrm{lbs}$ is sufficient to provide maximum power dissipation capability. The compression washer helps to maintain a constant pressure on the package over time and during large temperature excursions.

Destructive laboratory tests show that using a hex head 4-40 screw, without washers, and applying a torque in excess of $20 \mathrm{in} \cdot \mathrm{lbs}$ will cause the plastic to crack around the mounting hole, resulting in a loss of isolation capability.

Additional tests on slotted 4-40 screws indicate that the screw slot fails between 15 to $20 \mathrm{in} \cdot \mathrm{lbs}$ without adversely affecting the package. However, in order to positively ensure the package integrity of the fully isolated device, ON Semiconductor does not recommend exceeding 10 in $\cdot \mathrm{lbs}$ of mounting torque under any mounting conditions.
