# **Buck Regulator, 3.0 A**

# **FAN53527**

## **Descriptions**

The FAN53527 is a step-down switching voltage regulator with an input voltage supply range of 2.5 V to 5.5 V. Device settings can be programmed through an I<sup>2</sup>C interface, or the IC can be operated in stand-alone mode with pin controls for enable, output voltage, and Auto PFM or Forced PWM operation.

Using a proprietary architecture with synchronous rectification, the FAN53527 is capable of delivering 3.0 A continuous at over 80% efficiency, and maintain that efficiency with load currents as low as 10 mA. At moderate and light loads, Pulse Frequency Modulation (PFM) is used to operate in Power–Save Mode where excellent transient response is maintained. In Shutdown Mode, the supply current drops below 1  $\mu$ A, further reducing power consumption. At higher loads, the device automatically transitions to fixed–frequency PWM control, operating typically at 2.4 MHz.

The FAN53527 is available in a 15-bump, 1.310 mm x 2.015 mm, 0.4 mm ball pitch, Wafer-Level Chip-Scale Package (WLCSP).

#### **Features**

- I<sup>2</sup>C Compatible Interface or Stand-Alone Operation
- Fixed-Frequency PWM Operation: 2.4 MHz
- Auto PFM Mode for High Efficiency at Light-Load
- Best-in-Class Load Transient Response
- Wide Input Voltage Range: 2.5 V to 5.5 V
- Continuous Output Current Capability: 3.0 A
- Low Quiescent Current: 48 μA
- Low Shutdown Current: <1 μA
- Input Under-Voltage Lockout (UVLO)
- Thermal Shutdown and Overload Protection
- Programmable/ Selectable Output Voltage:
  - 1 V to 1.39375 V in 6.25 mV Steps (I<sup>2</sup>C Programmable)
  - 1.125 V & 1.081 V (Pin Selectable Values)
- Programmable Output Voltage Transition Slew Rate

## **Applications**

- Application, Graphic, and DSP Processors
- Hard Disk Drives, LPDDR4, LPDDR5
- Smart Phones
- Gaming Devices
- Tablets, Netbooks, Ultra-Mobile PCs

# **PIN CONFIGURATION**

Top View

**Bottom View** 

Figure 2. Pin Configuration

# **Table 4. PIN DEFINITIONS**

| Pin        | Name | Description  |
|------------|------|--|
| A1, B1, C1 | VIN  | Input Voltage Power input to converter. Place input decoupling capacitor, CIN, as close to this pin as                                   |
| A2, B2     | SW   | Switching Node<br>Connect to one side of the inductor.   |
| A3, B3     | PGND | Power Ground The low-side MOSFET is referenced to this pin. CIN and COUT should be returned to this pin with minimal path resistance.    |
| СЗ         | AGND | Analog Ground<br>Ground pin for control circuitry.   |
| E2         | SCL  | Serial Interface Clock I <sup>2</sup> C Clock input pin. Avoid routing near noise sensitive traces.                                      |
| D3         | SDA  | Serial Interface Data I <sup>2</sup> C input/output data line pin. Do not leave this pin floating.                                       |
| E3         | VOUT | Output Voltage Feedback Connect to positive side of output capacitor.  |
| D1         | VSEL | Output Voltage Selection Selects between registers VSEL0 or VSEL1 programmed voltages. LOW = VSEL0 and HIGH = VSEL1.                     |
| C2         | MODE | PFM/PWM MODE Selects between Automatic PFM/PWM (Auto PFM) operation and Forced PWM operation.  LOW = Auto PFM/PWM and HIGH = Forced PWM. |

## **Table 5. ABSOLUTE MAXIMUM RATINGS**

| Symbol                 | Parameter  | Parameter        | Min  | Max          | Unit |
|------------------------|--|------------------|------|--------------|------|
| V <sub>IN</sub>        | Voltage on SW, VIN Pins                                  | IC Not Switching | -0.3 | 7.0          | V    |
|                        |  | IC Switching     | -0.3 | 5.0          |      |
|                        | Voltage on EN Pin  |                  | -0.3 | VIN (Note 1) |      |
|                        | Voltage on All Other Pins                                | IC Not Switching | -0.3 | VIN (Note 1) |      |
| V <sub>OUT</sub>       | Voltage on VOUT Pin                                      | -0.3             | 5.0  | V            |      |
| V <sub>INOV_SLEW</sub> | Maximum Slew Rate of V <sub>IN</sub> > 6.5V, PWM Switchi | ng               |      | 100          | V/ms |
| ESD                    | Human Body Model, ANSI/ESDA/JEDEC JS-001                 | 1–2012           | 20   | 00           | V    |
|                        | Charged Device Model per JESD22-C101                     |                  | 10   | 00           |      |
| T <sub>J</sub>         | Junction Temperature                                     |                  | -40  | +150         | °C   |
| T <sub>STG</sub>       | Storage Temperature                                      |                  | -65  | +150         | °C   |
| $T_L$                  | Lead Soldering Temperature, 10 Seconds                   |                  |      | +260         | °C   |

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

## **Table 6. RECOMMENDED OPERATING CONDITIONS**

| Symbol           | Parameter                      | Min | Тур | Max  | Unit |
|------------------|--------------------------------|-----|-----|------|------|
| V <sub>IN</sub>  | Supply Voltage Range           | 2.5 |     | 5.5  | V    |
| I <sub>OUT</sub> | Output Current                 | 0   |     | 3.0  | Α    |
| T <sub>A</sub>   | Operating Ambient Temperature  | -40 |     | +85  | °C   |
| TJ               | Operating Junction Temperature | -40 |     | +125 | °C   |

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

### **Table 7. THERMAL PROPERTIES**

| Symbol        | Parameter                              | Min | Тур | Max | Unit |
|---------------|--|-----|-----|-----|------|
| $\theta_{JA}$ | Junction-to-Ambient Thermal Resistance |     | 42  |     | °C/W |

NOTE: Junction-to-ambient thermal resistance is a function of application and board layout. This data is simulated with four-layer 2s2p boards with vias in accordance to JESD51- JEDEC standard. Special attention must be paid not to exceed the junction temperature T<sub>J(max)</sub> at a given ambient temperate T<sub>A</sub>.

<sup>1.</sup> Lesser of 7V or  $V_{IN}$  + 0.3  $\dot{V}$ .

**Table 8. ELECTRICAL CHARACTERISTICS** Minimum and maximum values are at  $V_{IN} = 3.6 \text{ V}$ ,  $T_A = -40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ , unless otherwise noted. Typical values are at  $T_A = 25^{\circ}\text{C}$ ,  $V_{IN} = 3.6 \text{ V}$ , and  $V_{OUT} = 1.081 \text{ V}$ .

## **Operating Description**

The FAN53527 is a step-down switching voltage regulator that delivers a programmable output voltage from an input voltage supply of 2.5 V to 5.5 V. Using a proprietary architecture with synchronous rectification, the FAN53527 is capable of delivering 3.0 A at over 80% efficiency. The regulator operates at a nominal frequency of 2.4 MHz at full load, which reduces the value of the external components to 330 nH or 470 nH for the output inductor and 44  $\mu F$  for the output capacitor. High efficiency is maintained at light load with single-pulse PFM.

An I<sup>2</sup>C-compatible interface allows transfers up to 3.4 Mbps. This communication interface can be used to:

- Dynamically re-program the output voltage in 6.25 mV increments;
- Reprogram the mode to enable or disable PFM;
- Control voltage transition slew rate; or
- Enable / disable the regulator

## **Control Scheme**

The FAN53527 uses a proprietary non-linear, fixed-frequency PWM modulator to deliver a fast load transient response, while maintaining a constant switching frequency over a wide range of operating conditions. The regulator performance is independent of the output capacitor ESR, allowing for the use of ceramic output capacitors. Although this type of operation normally results in a switching frequency that varies with input voltage and load current, an internal frequency loop holds the switching frequency constant over a large range of input voltages and load currents.

For very light loads, the FAN53527 operates in Discontinuous Current Mode (DCM) single-pulse PFM, which produces low output ripple compared with other PFM architectures. Transition between PWM and PFM is relatively seamless, providing a smooth transition between DCM and CCM Modes.

PFM can be disabled by programming the MODE bits in the CONTROL register in combination with the state of the VSEL pin or simply by setting the MODE pin high. See Table 2.

#### **Enable and Soft-Start**

When the EN pin is LOW; the IC is shut down, all internal circuits are off, and the part draws very little current. In this state, I<sup>2</sup>C can be written to or read from as long as input voltage is above the UVLO. The registers keep the content when the EN pin is LOW. The registers are reset to default values during a Power On Reset (POR). When the OUTPUT\_DISCHARGE bit in the Control register is enabled (logic HIGH) and the EN pin is LOW or the BUCK\_ENx bit is LOW, an 11 W load is connected from VOUT to GND to discharge the output capacitors.

Raising EN while the BUCK\_ENx bit is HIGH activates the part and begins the soft-start cycle. During soft-start, the modulator's internal reference is ramped slowly to minimize surge currents on the input and prevent overshoot of the output voltage. Synchronous rectification is inhibited, allowing the IC to start into a pre-charged capacitive load.

If large values of output capacitance are used, the regulator may fail to start. The maximum  $C_{OUT}$  capacitance for starting with a heavy constant-current load is approximately:

$$C_{OUTMAX} \approx (I_{LMPK} - I_{LOAD}) \cdot \frac{320\mu}{V_{OUT}}$$
 (eq. 1)

where C<sub>OUTMAX</sub> is expressed in µF and I<sub>LOAD</sub> is the load current during soft–start, expressed in A.

If the regulator is at its current limit for 16 consecutive current limit cycles, the regulator shuts down and enters tri–state before reattempting soft–start 1700 µs later. This limits the duty cycle of full output current during soft–start to prevent excessive heating.

The IC allows for software enable of the regulator, when EN is HIGH, through the BUCK\_EN bits. BUCK\_EN0 and BUCK\_EN1 are both set to "1" by default. These options start after a POR, regardless of the state of the VSEL pin.

## VSEL Pin and I<sup>2</sup>C Programming Output Voltage

The output voltage is set by the NSELx control bits in VSEL0 and VSEL1 registers. The output is given as:

$$V_{OUT} = 1.000 \text{ V} + [(NSELx - 64) \cdot 6.25 \text{ mV}]$$
 (eq. 2)

For example, if NSEL =1010000 (80 decimal), then  $V_{OUT}$  = 1.000 + 0.100 = 1.100 V.

Output voltage can also be controlled by toggling the VSEL pin LOW or HIGH. VSEL LOW corresponds to

VSEL0 and VSEL HIGH corresponds to VSEL1. Upon POR, VSEL0 and VSEL1 are reset to their default voltages, as shown in Table 1.

#### **Transition Slew Rate Limiting**

When transitioning from a low to high voltage, the IC can be programmed for one of eight possible slew rates using the SLEW bits in the Control register, as shown in the table below.

**Table 11. TRANSITION SLEW RATE** 

| Decimal | Bin | Slew Rate |       |
|---------|-----|-----------|-------|
| 0       | 000 | 64.00     | mV/μs |
| 1       | 001 | 32.00     | mV/μs |
| 2       | 010 | 16.00     | mV/μs |
| 3       | 011 | 8.00      | mV/μs |
| 4       | 100 | 4.00      | mV/μs |
| 5       | 101 | 2.00      | mV/μs |
| 6       | 110 | 1.00      | mV/μs |
| 7       | 111 | 0.50      | mV/μs |

Transitions from high to low voltage rely on the output load to discharge  $V_{OUT}$  to the new set point. Once the high-to-low transition begins, the IC stops switching until  $V_{OUT}$  has reached the new set point.

## Under-Voltage Lockout (UVLO)

When EN is HIGH, the under-voltage lockout keeps the part from operating until the input supply voltage rises HIGH enough to properly operate. This ensures proper operation of the regulator during startup or shutdown.

## Input Over-Voltage Protection (OVP)

When  $V_{\rm IN}$  exceeds  $V_{\rm SDWN}$  (~ 6.2 V), the IC stops switching to protect the circuitry from internal spikes above 6.5 V. An internal filter prevents the circuit from shutting down due to noise spikes.

### **Current Limiting**

A heavy load or short circuit on the output causes the current in the inductor to increase until a maximum current threshold is reached in the high–side switch. Upon reaching this point, the high–side switch turns off, preventing high currents from causing damage. 16 consecutive current limit cycles in current limit, cause the regulator to shut down and stay off for about 1700  $\mu s$  before attempting a restart.

#### **Thermal Shutdown**

When the die temperature increases, due to a high load condition and/or high ambient temperature, the output switching is disabled until the die temperature falls sufficiently. The junction temperature at which the thermal shutdown activates is nominally 150°C with a 17°C hysteresis.

## Monitor Register (Reg05)

The Monitor register indicates of the regulation state of the IC. If the IC is enabled and is regulating, its value is (1000 0001).

## I<sup>2</sup>C Interface

The serial interface is compatible with Standard, Fast, Fast Plus, and HS Mode I<sup>2</sup>C Bus® specifications. The SCL line is an input and its SDA line is a bi-directional open-drain output; it can only pull down the bus when active. The SDA line only pulls LOW during data reads and when signaling ACK. All data is shifted in MSB (bit 7) first.

## I<sup>2</sup>C Slave Address

The slave address uses the standard 7 most significant bits for defining the address and the LSB as the read/write bit. In doing so, the first word consists of bit [7:5] and the second word utilizes bits [4:1]. Thus the slave address is 60. Other slave addresses can be assigned. Contact an On Semiconductor representative.

Table 12. I<sup>2</sup>C SLAVE ADDRESS

|         | Bits |   |   |   |   |   |   |   |
|---------|------|---|---|---|---|---|---|---|
| Address | 7    | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| 60      | 1    | 1 | 0 | 0 | 0 | 0 | 0 | Х |

Other slave addresses can be assigned. Contact an ON Semiconductor representative.

#### **Bus Timing**

As shown in Figure 19 data is normally transferred when SCL is LOW. Data is clocked in on the rising edge of SCL. Typically, data transitions shortly at or after the falling edge of SCL to allow sufficient time for the data to set up before the next SCL rising edge.

Figure 19. Data Transfer Timing

Each bus transaction begins and ends with SDA and SCL HIGH. A transaction begins with a START condition, which is defined as SDA transitioning from 1 to 0 with SCL HIGH, as shown in Figure 20.

Figure 20. START Bit

A transaction ends with a STOP condition, defined as SDA transitioning from 0 to 1 with SCL high, as shown in Figure 21.

Figure 21. STOP Bit

During a read from the FAN53527, the master issues a REPEATED START after sending the register address and before resending the slave address. The REPEATED START is a 1 to 0 transition on SDA while SCL is HIGH, as shown in Figure 22.

Figure 22. REPEATED START Timing

## High-Speed (HS) Mode

The protocols for High-Speed (HS), Low-Speed (LS), and Fast-Speed (FS) Modes are identical; except the bus speed for HS Mode is 3.4 MHz. HS Mode is entered when the bus master sends the HS master code 00001XXX after a START condition (Figure 20). The master code is sent in Fast or Fast-Plus Mode (less than 1 MHz clock); slaves do not ACK this transmission.

The master generates a REPEATED START condition (Figure 22) that causes all slaves on the bus to switch to HS Mode. The master then sends I<sup>2</sup>C packets, as described above, using the HS Mode clock rate and timing.

The bus remains in HS Mode until a STOP bit (Figure 21) is sent by the master. While in HS Mode, packets are separated by REPEATED START conditions (Figure 22).

## **Read and Write Transactions**

The following figures outline the sequences for data read and write. Bus control is signified by the shading of the packet, defined as:

All addresses and data are MSB first.

### **APPLICATION INFORMATION**

## Selecting the Inductor

The output inductor must meet both the required inductance and the energy-handling capability of the application. The inductor value affects the average current limit, the output voltage ripple, and the efficiency.

The ripple current ( $\Delta I$ ) of the regulator is:

$$\Delta I \approx \frac{V_{OUT}}{V_{IN}} \cdot \left(\frac{V_{IN} - V_{OUT}}{L \cdot f_{SW}}\right)$$
 (eq. 3)

The maximum average load current,  $I_{MAX(LOAD)}$ , is related to the peak current limit,  $I_{LIM(PK)}$ , by the ripple current such that:

$$I_{MAX(LOAD)} = I_{LIM(PK)} - \frac{\Delta I}{2}$$
 (eq. 4)

The FAN53527 is optimized for operation with L = 470 nH, but is stable with inductances up to 1.0  $\mu$ H (nominal). The inductor should be rated to maintain at least 80% of its value at  $I_{LIM(PK)}$ . Failure to do so decreases the amount of DC current the IC can deliver.

Efficiency is affected by the inductor DCR and inductance value. Decreasing the inductor value for a given physical size typically decreases the DCR; but since  $\Delta I$  increases, the RMS current increases, as do core and skin–effect losses:

$$I_{RMS} = \sqrt{I_{OUT(DC)}^2 + \frac{\Delta I^2}{12}}$$
 (eq. 5)

The increased RMS current produces higher losses through the  $R_{DS(ON)}$  of the IC MOSFETs and the inductor ESR.

Increasing the inductor value produces lower RMS currents, but degrades transient response. For a given physical inductor size, increased inductance usually results in an inductor with lower saturation current.

The increased RMS current produces higher losses through the  $R_{DS(ON)}$  of the IC MOSFETs and the inductor ESR.

Increasing the inductor value produces lower RMS currents, but degrades transient response. For a given physical inductor size, increased inductance usually results in an inductor with lower saturation current.

## **Inductor Current Rating**

The current-limit circuit can allow substantial peak currents to flow through L1 under worst-case conditions. If it is possible for the load to draw such currents, the inductor should be capable of sustaining the current or failing in a safe manner.

# Output Capacitor and V<sub>OUT</sub> Ripple

Increasing  $C_{OUT}$  has negligible effect on loop stability and can be increased to reduce output voltage ripple or to improve transient response. Output voltage ripple,  $\Delta V_{OUT}$ , is calculated by:

$$\Delta V_{OUT} = \Delta I_L \left[ \frac{f_{SW} \cdot C_{OUT} \cdot ESR^2}{2 \cdot D \cdot (1 - D)} + \frac{1}{8 \cdot f_{SW} \cdot C_{OUT}} \right] \quad \text{(eq. 6)}$$

where C<sub>OUT</sub> is the effective output capacitance.

The capacitance of  $C_{OUT}$  decreases at higher output voltages, which results in higher  $\Delta V_{OUT}$ . Equation 6 is only valid for CCM operation, which occurs in PWM Mode.

The FAN53527 can be used with either 2 x 22  $\mu$ F (0603) or 2 x 47  $\mu$ F (0603) output capacitor configuration. If a tighter ripple and transient specification is need from the FAN53527, then the 2 x 47  $\mu$ F is recommended.

The lowest  $\Delta V_{OUT}$  is obtained when the IC is in PWM Mode and, therefore, operating at 2.4 MHz. In PFM Mode,  $f_{SW}$  is reduced, causing  $\Delta V_{OUT}$  to increase.

#### **ESL Effects**

The Equivalent Series Inductance (ESL) of the output capacitor network should be kept low to minimize the square—wave component of output ripple that results from the division ratio  $C_{OUT}$  ESL and the output inductor ( $L_{OUT}$ ). The square—wave component due to the ESL can be estimated as:

$$\Delta V_{OUT(SQ)} \approx V_{IN} \cdot \frac{ESL_{COUT}}{L1}$$
 (eq. 7)

A good practice to minimize this ripple is to use multiple output capacitors to achieve the desired C<sub>OUT</sub> value.

To minimize ESL, use capacitors with the lowest ratio of length to width. Placing additional small-value capacitors near the load also reduces the high-frequency ripple components.

## **Input Capacitor**

The ceramic input capacitors should be placed as close as possible between the VIN and PGND pins to minimize the parasitic inductance. If a long wire is used to bring power to the IC, additional "bulk" capacitance (electrolytic or tantalum) should be placed between CIN and the power source lead to reduce under–damped ringing that can occur between the inductance of the power source leads and  $C_{\rm IN}$ .

### **Thermal Considerations**

Heat is removed from the IC through the solder bumps to the PCB copper. The junction–to–ambient thermal resistance  $(\theta_{JA})$  is largely a function of the PCB layout (size, copper weight, and trace width) and the temperature rise from junction to ambient  $(\Delta T)$ .

For the FAN53527,  $\theta_{JA}$  is 42°C/W when mounted on its four–layer with vias evaluation board in still air with 2 oz. outer layer copper weight and 1 oz. inner layer.

For long-term reliable operation, the junction temperature (T<sub>1</sub>) should be maintained below 125°C.

To calculate maximum operating temperature (<125°C) for a specific application:

 Use efficiency graphs to determine efficiency for the desired V<sub>IN</sub>, V<sub>OUT</sub>, and load conditions. 2. Calculate total power dissipation using:

$$P_{T} = V_{OUT} \cdot I_{LOAD} \cdot \left(\frac{1}{\eta} - 1\right) \tag{eq. 8}$$

3. Estimate inductor copper losses using:

$$P_{L} = I_{LOAD}^{2} \cdot DCR_{L}$$
 (eq. 9)

4. Determine IC losses by removing inductor losses (step 3) from total dissipation:

$$P_{IC} = P_{T} - P_{L}$$
 (eq. 10)

5. Determine device operating temperature:

$$\Delta T = P_{IC} \cdot \Theta_{JA} \quad T_{IC} = T_A + \Delta T \qquad \qquad \text{(eq. 11)}$$

and

Note that the  $R_{DS(ON)}$  of the power MOSFETs increases linearly with temperature at about 1.4%/°C. This causes the efficiency ( $\eta$ ) to degrade with increasing die temperature.

## **Layout Recommendations**

- The input capacitor (C<sub>IN</sub>) should be connected as close as possible to the VIN and GND pins.
   Connect to VIN and GND using only top metal.
   Do not route through vias.
- 2. Place the inductor (L) as close as possible to the IC. Use short wide traces for the main current paths.
- 3. The output capacitor ( $C_{OUT}$ ) should be as close as possible to the IC. Connection to GND should be on top metal. Feedback signal connection to VOUT should be routed away from noisy components and traces (e.g. SW line). For remote sensing application, place one or all output capacitors near the load and if there are also output capacitors placed near the inductor, the maximum trace resistance between the inductor and the load should not exceed 30 m $\Omega$ .

ON Semiconductor and are trademarks of Semiconductor Components Industries, LLC dba ON Semiconductor or its subsidiaries in the United States and/or other countries. ON Semiconductor reserves the right to make changes without further notice to any products herein. ON Semiconductor makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does ON Semiconductor assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. ON Semiconductor does not convey any license under its patent rights nor the rights of others.

onsemi, ONSEMI, and other names, marks, and brands are registered and/or common law trademarks of Semiconductor Components Industries, LLC dba "onsemi" or its affiliates and/or subsidiaries in the United States and/or other countries. onsemi owns the rights to a number of patents, trademarks, copyrights, trade secrets, and other intellectual property. A listing of onsemi's product/patent coverage may be accessed at <a href="www.onsemi.com/site/pdf/Patent-Marking.pdf">www.onsemi.com/site/pdf/Patent-Marking.pdf</a>. onsemi reserves the right to make changes at any time to any products or information herein, without notice. The information herein is provided "as-is" and onsemi makes no warranty, representation or guarantee regarding the accuracy of the information, product features, availability, functionality, or suitability of its products for any particular purpose, nor does **onsemi** assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. Buyer is responsible for its products and applications using **onsemi** products, including compliance with all laws, regulations and safety requirements or standards, regardless of any support or applications information provided by **onsemi**. "Typical" parameters which may be provided in **onsemi** data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. **onsemi** does not convey any license under any of its intellectual property rights nor the rights of others. **onsemi** products are not designed, intended, or authorized for use as a critical component in life support systems or any FDA Class 3 medical devices or medical devices with a same or similar classification in a foreign jurisdiction or any devices intended for implantation in the human body. Should Buyer purchase or use **onsemi** products for any such unintended or unauthorized application, Buyer shall indemnify and hold **onsemi** and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that **onsemi** was negligent regarding the design or manufacture of the part. **onsemi** is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
