## Hex 3-State Noninverting Buffer with Common Enables

### High-Performance Silicon-Gate CMOS

The MC74HC365A is identical in pinout to the LS365. The device inputs are compatible with standard CMOS outputs; with pullup resistors, they are compatible with LSTTL outputs.

This device is a high-speed hex buffer with 3-state outputs and two common active-low Output Enables. When either of the enables is high, the buffer outputs are placed into high-impedance states. The HC365A has noninverting outputs.

#### Features

- Output Drive Capability: 15 LSTTL Loads
- Outputs Directly Interface to CMOS, NMOS, and TTL
- Operating Voltage Range: 2.0 to 6.0 V
- Low Input Current: 1.0  $\mu$ A
- High Noise Immunity Characteristic of CMOS Devices
- In Compliance with the Requirements Defined by JEDEC Standard No. 7A
- Chip Complexity: 90 FETs or 22.5 Equivalent Gates
- NLV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high-impedance circuit. For proper operation,  $V_{in}$  and  $V_{out}$  should be constrained to the range  $GND \leq (V_{in} \text{ or } V_{out}) \leq V_{CC}$ . Unused inputs must always be tied to an appropriate logic voltage level (e.g., either GND or  $V_{CC}$ ). Unused outputs must be left open.

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

**Figure 4.**

The diagram illustrates a 6-to-1 multiplexer circuit. It features six buffers, each receiving 'INPUT A'. The outputs of these buffers are connected to two AND gates. The first AND gate has two inputs: the output of the first buffer and the output of a 2-input AND gate formed by 'OUTPUT ENABLE 1' and 'OUTPUT ENABLE 2'. The second AND gate has two inputs: the output of the sixth buffer and the output of the same 2-input AND gate. The outputs of these two AND gates are connected to a common output line 'Y'. The circuit is labeled 'TO OTHER FIVE BUFFERS' and 'ONE OF 6 BUFFERS'.
