

NCP4586

Voltage Regulator - Low Noise, Low Dropout

150 mA

The NCP4586 is a CMOS 150 mA low dropout linear with low noise, high ripple rejection, low dropout, high output voltage accuracy and low supply current. The device is available in three configurations: enable high, enable low and enable high plus auto-discharge. Small packages allow mounting on high density PCBs. This is an excellent general purpose regulator, well suited to many applications.

Features

- Operating Input Voltage Range: 1.7 V to 6.5 V
- Output Voltage Range: 1.2 to 5.0 V (available in 0.1 V steps)
- Very Low Dropout: 320 mV Typ. at 150 mA
- $\pm 1\%$ Output Voltage Accuracy ($V_{OUT} > 2\text{ V}$, $T_J = 25^\circ\text{C}$)
- High PSRR: 80 dB at 1 kHz
- Current Fold Back Protection
- Stable with a 0.47 μF Ceramic Capacitors
- Available in 1.0 x 1.0 UDFN, SC-82AB and SOT23-5 Package
- These are Pb-Free Devices

Typical Applications

- Battery Powered Equipment
- Portable Communication Equipment
- Cameras, MP3 Players and Camcorder
- High Stability Voltage Reference

APPLICATION INFORMATION

A typical application circuit for NCP4586 series is shown in Figure 42.

Figure 42. Typical Application Schematic

Input Decoupling Capacitor (C1)

A 470 nF ceramic input decoupling capacitor should be connected as close as possible to the input and ground pin of the NCP4586. Higher values and lower ESR improves line transient response.

Output Decoupling Capacitor (C2)

A 470 nF or larger ceramic output decoupling capacitor is sufficient to achieve stable operation of the IC. If a tantalum capacitor is used, and its ESR is high, loop oscillation may result. The capacitors should be connected as close as possible to the output and ground pins. Larger values and lower ESR improves dynamic parameters.

Enable Operation

The Enable pin \overline{CE} or CE may be used for turning the regulator on and off. Control polarity is dependent on

version of IC. Active high or low versions are available; please see the ordering information table. The Enable pin has an internal pull down current source for versions H and D. If the enable function is not needed connect the \overline{CE} pin to ground for version L or connect the CE pin to VIN for versions H and D.

Output Discharger

The D version includes a transistor between VOUT and GND that is used for faster discharging of the output capacitor. This function is activated when the IC goes into disable mode.

Thermal

As power across the IC increases, it might become necessary to provide some thermal relief. The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material, and also the ambient temperature affect the rate of temperature rise for the part. That is to say, when the device has good thermal conductivity through the PCB, the junction temperature will be relatively low with high power dissipation applications.

PCB Layout

Make VIN and GND line sufficient. If their impedance is high, noise pickup or unstable operation may result. Connect capacitors C1 and C2 as close as possible to the IC, and make wiring as short as possible.
