NCP4626

Voltage Regulator - Low Dropout, Reverse Current Protection

300 mA

The NCP4626 is a CMOS 300 mA low dropout linear regulator with a wide input voltage range of 3.5 V to 16 V, low supply current and high output voltage accuracy. Through an ECO mode selector pin the device can be operated in low power mode to reduce quiescent current or fast mode for better transient response and lower dropout. The NCP4626 is suitable for applications where the V_{OUT} pin voltage may be higher than the V_{IN} pin voltage as it is protected against reverse current. The device has a maximum input voltage tolerance of 18 V, comes with or without an auto-discharge feature on the output, and is available in a choice of XDFN, SOT89 and SOT23 packages.

Features

- Operating Input Voltage Range: 3.5 V to 16.0 V
- Output Voltage Range: 2.0 to 15.0 V (available in 0.1 V steps)
- Low Quiescent current (6 μ A typ.) in Low Power Mode
- Dropout Voltage:
 - 550 mV typ. (I_{OUT} = 300 mA, V_{OUT} = 5 V, Fast Mode)
 - 700 mV typ. (I_{OUT} = 300 mA, V_{OUT} = 5 V, Low Power Mode)
- Output Voltage Accuracy: $\pm 1.5\%$ (Fast Mode)
 $\pm 2.5\%$ (Low Power Mode)
- High PSRR: 60 dB at 1 kHz
- Current Fold Back Protection
- Thermal Shutdown Protection
- Stable with a C_{IN} = 2.2 μ F and C_{OUT} = 4.7 μ F Ceramic Capacitors
- Available in 1.6x1.6 XDFN6, SOT89-5 and SOT23-5 Package
- These are Pb-Free Devices

Typical Applications

- Digital Home Appliances
- Audio Visual Equipment
- Battery backup circuits

APPLICATION INFORMATION

A typical application circuit for NCP4626 series is shown in Figure 84.

Figure 84. Typical Application Schematic

Input Decoupling Capacitor (C1)

A 2.2 μF (or larger) ceramic input decoupling capacitor should be connected as close as possible to the input and ground pin of the NCP4626. Higher capacitor values and lower ESR improves line transient response.

Output Decoupling Capacitor (C2)

A 4.7 μF (or larger) ceramic output decoupling capacitor is sufficient to achieve stable operation of the IC. It is necessary to use a capacitor with good frequency characteristics and low ESR. The capacitor should be connected as close as possible to the output and ground pins. Larger capacitor values and lower ESR improves dynamic parameters.

Enable Operation

The enable pin CE may be used to turn the regulator on and off. The IC is switched on when a high level voltage is applied to the CE pin. The enable pin has an internal pull down resistor. If the enable function is not needed, connect the CE pin to VIN.

Output Discharger

The D version of the NCP4626 includes a transistor between VOUT and GND that is used for faster discharging of the output capacitor. This function is activated when the IC goes into disable mode.

Current Limit

This regulator includes fold-back type current limit circuit. This type of protection doesn't limit current up to

current capability in normal operation, but when over current occurs, output voltage and current decrease until over current condition ends. Typical characteristics of this protection type can be observed in the Output Voltage versus Output Current graphs shown in the typical characteristics chapter of this datasheet.

ECO Function

The IC can be switched between two modes by ECO pin. One mode is low power mode, where IC's self current consumption is low, but IC has slower dynamic behavior or in to fast mode, where current consumption is higher, but the IC has better dynamic response and lower dropout voltage. Do not leave the ECO pin unconnected or between V_{CEH} and V_{CEL} voltage levels as this may cause indefinite and unexpected currents flows internally.

Thermal Considerations

As power across the IC increases, it might become necessary to provide some thermal relief. The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material, and the ambient temperature effect the rate of temperature rise for the part. That is to say, when the device has good thermal conductivity through the PCB, the junction temperature will be relatively low with high power dissipation applications.

The IC includes internal thermal shutdown circuit that stops the regulator operating if the junction temperature is higher than 150°C. After shutdown, when the junction temperature decreases below 130°C, the voltage regulator would restarts. As long as the high power dissipation condition exists, the regulator will start and stop repeatedly to protect itself against overheating. Care should be taken in the PCB layout to try to avoid this temperature cycling condition.

PCB Layout

Make the VIN and GND lines as large as possible. If their impedance is high, noise pickup or unstable operation may result. Connect capacitors C1 and C2 as close as possible to the IC, and make wiring as short as possible. The tab under the XDFN package is internally connected to GND: it is best practice to connect it to GND on the PCB, but leaving it unconnected is also acceptable.

NCP4626

PACKAGE DIMENSIONS

XDFN6 1.6x1.6, 0.5P
CASE 711AC-01
ISSUE O

NOTES:

1. DIMENSIONING AND TOLERANCING PER ASME Y14.5M, 1994.
2. CONTROLLING DIMENSION: MILLIMETERS.
3. COPLANARITY APPLIES TO THE EXPOSED PAD AS WELL AS THE TERMINALS.

MILLIMETERS		
DIM	MIN	MAX
A	---	0.40
A1	0.00	0.05
b	0.15	0.25
D	1.60 BSC	
D2	1.25	1.35
E	1.60 BSC	
E2	0.65	0.75
E3	0.15 REF	
e	0.50 BSC	
L	0.15	0.25
L1	0.05 BSC
