8-Bit Shift Register with Output Latches

MM74HC595

General Description

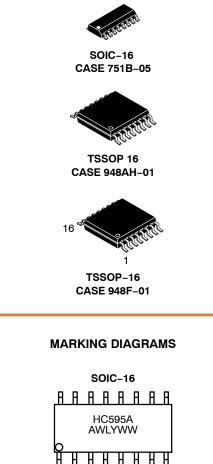

The MM74HC595 high-speed shift register utilizes advanced silicon-gate CMOS technology. This device possesses the high noise immunity and low power consumption of standard CMOS integrated circuits, as well as the ability to drive 15 LS-TTL loads.

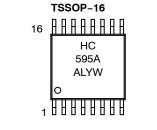

This device contains an eight-bit serial-in, parallel-out, shift register that feeds an eight-bit D-type storage register. The storage register has eight 3-state outputs. Separate clocks are provided for both the shift register and the storage register. The shift register has a direct-overriding clear, serial input, and serial output (standard) pins for cascading. Both the shift register and storage register use positive-edge triggered clocks. If both clocks are connected together, the shift register state is one clock pulse ahead of the storage register.

The 74HC logic family is speed, function, and pin–out compatible with the standard 74LS logic family. All inputs are protected from damage due to static discharge by internal diode clamps to $V_{\rm CC}$ and ground.

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product

performance may not be indicated by the Electrical Characteristics for the latter test conditions, unless otherwise noted. Froduct performance may not be indicated by the Electrical Characteristics if operated under different conditions. 2. For a power supply of 5 V ±10% the worst–case output voltages (V_{OH}, and V_{OL}) occur for HC at 4.5 V. The 4.5 V values should be used when designing with this supply. Worst–case V_{IH} and V_{IL} occur at V_{CC} = 5.5 V and 4.5 V, respectively; V_{IH} value at 5.5 V is 3.85 V. The worst case leakage current (I_{IN}, I_{CC}, and I_{OZ}) occur for CMOS at the higher voltage; so the 6.0 V values should be used.
