

NCS2502

650 μ A 110 MHz Current Feedback Op Amp with Enable Feature

NCS2502 is a 650 μ A 110MHz current feedback monolithic operational amplifier featuring high slew rate and low differential gain and phase error. The current feedback architecture allows for a superior bandwidth and low power consumption. This device features an enable pin.

Features

- -3.0 dB Small Signal BW ($A_V = +2.0$, $V_O = 0.5 V_{p-p}$) 110 MHz Typ
- Slew Rate 230 V/ μ s
- Supply Current 650 μ A
- Input Referred Voltage Noise 5 nV/ $\sqrt{\text{Hz}}$
- THD -49 dB ($f = 5.0$ MHz, $V_O = 2.0 V_{p-p}$)
- Output Current 80 mA
- Enable Pin Available
- Pin Compatible with EL5160, MAX4452
- Pb-Free Packages are Available

Applications

- Portable Video
- Line Drivers
- Radar/Communication Receivers
- Set Top Box
- NTSC/PAL/HDTV

Figure 1. Frequency Response: Gain (dB) vs. Frequency $A_V = +2.0$

Figure 2. Simplified Device Schematic

ATTRIBUTES

Characteristics	Value
ESD	
Human Body Model	2.0 kV (Note 1)
Machine Model	200 V
Charged Device Model	1.0 kV
Moisture Sensitivity (Note 2)	Level 1
Flammability Rating Oxygen Index: 28 to 34	UL 94 V-0 @ 0.125 in

1. 0.8 kV between the input pairs +IN and -IN pins only. All other pins are 2.0 kV.
2. For additional information, see Application Note AND8003/D.

MAXIMUM RATINGS

Parameter	Symbol	Rating	Unit
Power Supply Voltage	V_S	11	V_{DC}
Input Voltage Range	V_I	$\leq V_S$	V_{DC}
Input Differential Voltage Range	V_{ID}	$\leq V_S$	V_{DC}
Output Current	I_O	100	mA
Maximum Junction Temperature (Note 3)	T_J	150	$^{\circ}C$
Operating Ambient Temperature	T_A	-40 to +85	$^{\circ}C$
Storage Temperature Range	T_{stg}	-60 to +150	$^{\circ}C$
Power Dissipation	P_D	(See Graph)	mW
Thermal Resistance, Junction-to-Air	$R_{\theta JA}$		$^{\circ}C/W$
SO-8		172	
SC70-6		215	
SOT23-6		154	

Maximum ratings are those values beyond which device damage can occur. Maximum ratings applied to the device are individual stress limit values (not normal operating conditions) and are not valid simultaneously. If these limits are exceeded, device functional operation is not implied, damage may occur and reliability may be affected.

3. Power dissipation must be considered to ensure maximum junction temperature (T_J) is not exceeded.

MAXIMUM POWER DISSIPATION

The maximum power that can be safely dissipated is limited by the associated rise in junction temperature. For the plastic packages, the maximum safe junction temperature is 150 $^{\circ}C$. If the maximum is exceeded momentarily, proper circuit operation will be restored as soon as the die temperature is reduced. Leaving the device in the “overheated” condition for an extended period can result in device damage.

Figure 3. Power Dissipation vs. Temperature

General Design Considerations

The current feedback amplifier is optimized for use in high performance video and data acquisition systems. For current feedback architecture, its closed-loop bandwidth depends on the value of the feedback resistor. The closed-loop bandwidth is not a strong function of gain, as is for a voltage feedback amplifier, as shown in Figure 27.

Figure 27. Frequency Response vs. R_F

The -3.0 dB bandwidth is, to some extent, dependent on the power supply voltages. By using lower power supplies, the bandwidth is reduced, because the internal capacitance increases. Smaller values of feedback resistor can be used at lower supply voltages, to compensate for this affect.

Feedback and Gain Resistor Selection for Optimum Frequency Response

A current feedback operational amplifier's key advantage is the ability to maintain optimum frequency response independent of gain by using appropriate values for the feedback resistor. To obtain a very flat gain response, the feedback resistor tolerance should be considered as well. Resistor tolerance of 1% should be used for optimum flatness. Normally, lowering R_F resistor from its recommended value will peak the frequency response and extend the bandwidth while increasing the value of R_F resistor will cause the frequency response to roll off faster. Reducing the value of R_F

resistor too far below its recommended value will cause overshoot, ringing, and eventually oscillation.

Since each application is slightly different, it is worth some experimentation to find the optimal R_F for a given circuit. A value of the feedback resistor that produces ~ 0.1 dB of peaking is the best compromise between stability and maximal bandwidth. It is not recommended to use a current feedback amplifier with the output shorted directly to the inverting input.

Printed Circuit Board Layout Techniques

Proper high speed PCB design rules should be used for all wideband amplifiers as the PCB parasitics can affect the overall performance. Most important are stray capacitances at the output and inverting input nodes as it can effect peaking and bandwidth. A space ($3/16''$ is plenty) should be left around the signal lines to minimize coupling. Also, signal lines connecting the feedback and gain resistors should be short enough so that their associated inductance does not cause high frequency gain errors. Line lengths less than $1/4''$ are recommended.

Video Performance

This device designed to provide good performance with NTSC, PAL, and HDTV video signals. Best performance is obtained with back terminated loads as performance is degraded as the load is increased. The back termination reduces reflections from the transmission line and effectively masks transmission line and other parasitic capacitances from the amplifier output stage.

ESD Protection

This device is protected against electrostatic discharge (ESD) on all pins as specified in the attributes table. Note: Human Body Model for +IN and -IN pins are rated at 0.8 kV while all other pins are rated at 2.0 kV. Under closed-loop operation, the ESD diodes have no effect on circuit performance. However, under certain conditions the ESD diodes will be evident. If the device is driven into a slewing condition, the ESD diodes will clamp large differential voltages until the feedback loop restores closed-loop operation. Also, if the device is powered down and a large input signal is applied, the ESD diodes will conduct.
