## 14-Stage Binary Ripple Counter With Oscillator

### High-Performance Silicon-Gate CMOS

The MC74HC4060A is identical in pinout to the standard CMOS MC14060B. The device inputs are compatible with standard CMOS outputs; with pullup resistors, they are compatible with LSTTL outputs.

This device consists of 14 master-slave flip-flops and an oscillator with a frequency that is controlled either by a crystal or by an RC circuit connected externally. The output of each flip-flop feeds the next and the frequency at each output is half of that of the preceding one. The state of the counter advances on the negative-going edge of the Osc In. The active-high Reset is asynchronous and disables the oscillator to allow very low power consumption during stand-by operation.

State changes of the Q outputs do not occur simultaneously because of internal ripple delays. Therefore, decoded output signals are subject to decoding spikes and may have to be gated with Osc Out 2 of the HC4060A.

#### Features

- Output Drive Capability: 10 LSTTL Loads
- Outputs Directly Interface to CMOS, NMOS, and TTL
- Operating Voltage Range: 2.0 to 6.0 V
- Low Input Current: 1  $\mu$ A
- High Noise Immunity Characteristic of CMOS Devices
- In Compliance With JEDEC Standard No. 7A Requirements
- Chip Complexity: 390 FETs or 97.5 Equivalent Gates
- NLV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high-impedance circuit. For proper operation,  $V_{in}$  and  $V_{out}$  should be constrained to the range  $GND \leq (V_{in} \text{ or } V_{out}) \leq V_{CC}$ . Unused inputs must always be tied to an appropriate logic voltage level (e.g., either GND or  $V_{CC}$ ). Unused outputs must be left open.

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

## PIN DESCRIPTIONS

### INPUTS

#### Osc In (Pin 11)

Negative-edge triggering clock input. A high-to-low transition on this input advances the state of the counter. Osc In may be driven by an external clock source.

#### Reset (Pin 12)

Active-high reset. A high level applied to this input asynchronously resets the counter to its zero state (forcing all Q outputs low) and disables the oscillator.

### OUTPUTS

#### Q4—Q10, Q12—Q14 (Pins 7, 5, 4, 6, 13, 15, 1, 2, 3)

Active-high outputs. Each Q<sub>n</sub> output divides the Clock input frequency by 2<sup>N</sup>. The user should note the Q1, Q2, Q3 and Q11 are not available as outputs.

#### Osc Out 1, Osc Out 2 (Pins 9, 10)

Oscillator outputs. These pins are used in conjunction with Osc In and the external components to form an oscillator. When Osc In is being driven with an external clock source, Osc Out 1 and Osc Out 2 must be left open circuited. With the crystal oscillator configuration in Figure 6, Osc Out 2 must be left open circuited.

## PIERCE CRYSTAL OSCILLATOR DESIGN

Value are supplied by crystal manufacturer (parallel resonant crystal).

**Figure 8. Equivalent Crystal Networks**

NOTE:  $C = C_1 + C_{in}$  and  $R = R_1 + R_{out}$ .  $C_0$  is considered as part of the load.  $C_a$  and  $R_f$  typically have minimal effect below 2MHz.

**Figure 9. Series Equivalent Crystal Load**

Values are listed in Table 1.

**Figure 10. Parasitic Capacitances of the Amplifier**

## DESIGN PROCEDURES

The following procedure applies for oscillators operating below 2MHz where Z is a resistor R1. Above 2MHz, additional impedance elements should be considered:  $C_{out}$  and  $C_a$  of the amp, feedback resistor  $R_f$ , and amplifier phase shift error from 180°C.

Step 1: Calculate the equivalent series circuit of the crystal at the frequency of oscillation.

$$Z_e = \frac{-jX_{C_0}(R_s + jX_{L_s} - jX_{C_s})}{-jX_{C_0} + R_s + jX_{L_s} - jX_{C_s}} = R_e + jX_e$$

Reactance  $jX_e$  should be positive, indicating that the crystal is operating as an inductive reactance at the oscillation frequency. The maximum  $R_s$  for the crystal should be used in the equation.

Step 2: Determine  $\beta$ , the attenuation, of the feedback network. For a closed-loop gain of 2,  $A_v\beta = 2$ ,  $\beta = 2/A_v$  where  $A_v$  is the gain of the HC4060A amplifier.

Step 3: Determine the manufacturer's loading capacitance. For example: A manufacturer may specify an external load capacitance of 32pF at the required frequency.

Step 4: Determine the required Q of the system, and calculate  $R_{load}$ . For example, a manufacturer specifies a crystal Q of 100,000. In-circuit Q is arbitrarily set at 20% below crystal Q or 80,000. Then  $R_{load} = (2\pi f_o L_s / Q) - R_s$  where  $L_s$  and  $R_s$  are crystal parameters.

Step 5: Simultaneously solve, using a computer,

$$\beta = \frac{X_C \cdot X_{C2}}{R \cdot R_e + X_{C2} (X_e - X_C)} \quad (\text{with feedback phase shift} = 180^\circ) \quad (\text{Eq 1})$$

$$X_e = X_{C2} + X_C + \frac{R_e X_{C2}}{R} = X_{C_{load}} \quad (\text{where the loading capacitor is an external load, not including } C_0) \quad (\text{Eq 2})$$

$$R_{load} = \frac{R X_{C_0} X_{C2} [(X_C + X_{C2})(X_C + X_{C_0}) - X_C(X_C + X_{C_0} + X_{C2})]}{X^2_{C2}(X_C + X_{C_0})^2 + R^2(X_C + X_{C_0} + X_{C2})^2} \quad (\text{Eq 3})$$

Here  $R = R_{out} + R1$ .  $R_{out}$  is amp output resistance, R1 is Z. The C corresponding to  $X_C$  is given by  $C = C1 + C_{in}$ .

Alternately, pick a value for R1 (i.e., let  $R1 = R_s$ ). Solve Equations 1 and 2 for C1 and C2. Use Equation 3 and the fact that  $Q = 2\pi f_o L_s / (R_s + R_{load})$  to find in-circuit Q. If Q is not satisfactory pick another value for R1 and repeat the procedure.

#### CHOOSING R1

Power is dissipated in the effective series resistance of the crystal. The drive level specified by the crystal manufacturer is the maximum stress that a crystal can withstand without damage or excessive shift in frequency. R1 limits the drive level.

To verify that the maximum dc supply voltage does not overdrive the crystal, monitor the output frequency as a function of voltage at Osc Out 2 (Pin 9). The frequency should increase very slightly as the dc supply voltage is increased. An overdriven crystal will decrease in frequency or become unstable with an increase in supply voltage. The operating supply voltage must be reduced or R1 must be increased in value if the overdriven condition exists. The user should note that the oscillator start-up time is proportional to the value of R1.

#### SELECTING $R_f$

The feedback resistor,  $R_f$ , typically ranges up to 20M $\Omega$ .  $R_f$  determines the gain and bandwidth of the amplifier. Proper bandwidth insures oscillation at the correct frequency plus roll-off to minimize gain at undesirable frequencies, such as

the first overtone.  $R_f$  must be large enough so as to not affect the phase of the feedback network in an appreciable manner.

### NOTES:

1. DIMENSIONING AND TOLERANCING PER ANSI Y14.5M, 1982.
2. CONTROLLING DIMENSION: MILLIMETER.
3. DIMENSIONS D AND E DO NOT INCLUDE MOLD FLASH OR PROTRUSIONS AND ARE MEASURED AT THE PARTING LINE. MOLD FLASH OR PROTRUSIONS SHALL NOT EXCEED 0.15 (0.006) PER SIDE.
4. TERMINAL NUMBERS ARE SHOWN FOR REFERENCE ONLY.
5. THE LEAD WIDTH DIMENSION (b) DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL BE 0.08 (0.003) TOTAL IN EXCESS OF THE LEAD WIDTH DIMENSION AT MAXIMUM MATERIAL CONDITION. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE FOOT. MINIMUM SPACE BETWEEN PROTRUSIONS AND ADJACENT LEAD TO BE 0.46 (0.018).
