Keywords	PCA85073A, automotive RTC, RTC IC, I2C
Abstract	This data sheet provide detailed information on PCA85073A. It is a CMOS Real-Time Clock (RTC) and calendar optimized for low power consumption.

1 General description

The PCA85073A is a CMOS¹ Real-Time Clock (RTC) and calendar optimized for low power consumption. An offset register allows fine-tuning of the clock. All addresses and data are transferred serially via the two-line bidirectional I²C-bus. Maximum data rate is 400 kbit/s. The register address is incremented automatically after each written or read data byte.

For a selection of NXP Real-Time Clocks, see [Table 44](#).

2 Features and benefits

- AEC-Q100 grade 2 compliant for automotive applications
- Provides year, month, day, weekday, hours, minutes, and seconds based on a 32.768 kHz quartz crystal
- Low current; typical 0.25 μ A at $V_{DD} = 3.0$ V and $T_{amb} = 25$ °C
- Programmable clock output for peripheral devices (32.768 kHz, 16.384 kHz, 8.192 kHz, 4.096 kHz, 2.048 kHz, 1.024 kHz, and 1 Hz)
- Alarm function
- Minute and half minute interrupt
- Internal Power-On Reset (POR)
- High temperature operation range: -40 °C to +105 °C
- Clock operating voltage: 0.9 V to 5.5 V
- 400 kHz two-line I²C-bus interface (at $V_{DD} = 1.8$ V to 5.5 V)
- Selectable integrated oscillator load capacitors for $C_L = 7$ pF or $C_L = 12.5$ pF
- Countdown timer
- Oscillator stop detection function
- Programmable offset register for frequency adjustment
- Latch-up performance exceeds 100 mA per JESD 78, Class II
- ESD protection exceeds JESD 22
 - 4000 V Human-Body Model (A114-A)
 - 1000 V Charged-Device Model (C101)
- Package offered: TSSOP8

3 Applications

- Tracking time of the day
- Accurate timing
- Dashboard
- Infotainment unit
- Air condition
- Center stack
- Telematics
- Body control and battery management

¹ The definition of the abbreviations and acronyms used in this data sheet can be found in [Section 21](#).

4 Ordering information

Table 1. Ordering information

Type number	Topside marking	Package		
		Name	Description	Version
PCA85073ADP/Q900 ^[1]	073Q	TSSOP8	plastic thin shrink small outline package; 8 leads; body width 3 mm	SOT505-1

[1] Drop-in replacement for PCA85063ATT/A. The PCA85073ADP/Q900 leadframe is rougher for higher resistance to package delamination.

4.1 Ordering options

Table 2. Ordering options

Type number	Orderable part number	Package	Packing method	Minimum order quantity	Temperature
PCA85073ADP/Q900	PCA85073ADP/Q900Z	TSSOP8	REEL 13" Q1 NDP SSB ^[1]	2500	T _{amb} = -40 °C to +105 °C

[1] This Packing Method uses a Static Shielding Bag (SSB) solution. Material shall be kept in the sealed bag between uses.

6 Pinning information

6.1 Pinning

6.2 Pin description

Table 3. Pin description
Input or input/output pins must always be at a defined level (V_{SS} or V_{DD}) unless otherwise specified.

Symbol	Pin	Type	Description
OSCI	1	input	oscillator input
OSCO	2	output	oscillator output
INT ^[1]	3	output	interrupt output (open-drain)
VSS	4	supply	ground supply voltage
SDA ^[1]	5	input/output	serial data line
SCL ^[1]	6	input	serial clock input
CLKOUT	7	output	clock output (push-pull)
VDD	8	supply	supply voltage

[1] NXP recommends tying VDD of the device and VDD of all the external pull-up resistors to the same Power Supply.

7 Functional description

The PCA85073A contains 18 8-bit registers with an auto-incrementing register address, an on-chip 32.768 kHz oscillator with integrated capacitors, a frequency divider which provides the source clock for the Real-Time Clock (RTC) and calender, and an I²C-bus interface with a maximum data rate of 400 kbit/s.

The built-in address register will increment automatically after each read or write of a data byte up to the register 11h. After register 11h, the auto-incrementing will wrap around to address 00h (see [Figure 3](#)).

All registers (see [Table 4](#)) are designed as addressable 8-bit parallel registers although not all bits are implemented. The first two registers (memory address 00h and 01h) are used as control and status register. The register at address 02h is an offset register allowing the fine-tuning of the clock; and at 03h is a free RAM byte. The addresses 04h through 0Ah are used as counters for the clock function (seconds up to years counters). Address locations 0Bh through 0Fh contain alarm registers which define the conditions for an alarm. The registers at 10h and 11h are for the timer function.

The Seconds, Minutes, Hours, Days, Months, and Years as well as the corresponding alarm registers are all coded in Binary Coded Decimal (BCD) format. When one of the RTC registers is written or read, the contents of all time counters are frozen. Therefore, faulty writing or reading of the clock and calendar during a carry condition is prevented. For details on maximum access time, see [Section 7.4](#).

7.1 Registers organization

Table 4. Registers overview

Bit positions labeled as - are not implemented. After reset, all registers are set according to [Table 7](#).

Address	Register name	Bit								Reference	
		7	6	5	4	3	2	1	0		
Control and status registers

7.2 Control registers

To ensure that all control registers will be set to their default values, the V_{DD} level must be at zero volts at initial power-up. If this is not possible, a reset must be initiated with the software reset command when power is stable. Refer to [Section 7.2.1.3](#) for details.

7.2.1 Register Control_1

Table 5. Control_1 - control and status register 1 (address 00h) bit description

0	CAP_SEL		internal oscillator capacitor selection for quartz crystals with a corresponding load capacitance	-
		0 ^[1]	7 pF	
		1	12.5 pF	

[1] Default value.

[2] For a software reset, 0101 1000 (58h) must be sent to register Control_1 (see [Section 7.2.1.3](#)).

7.2.1.1 EXT_TEST: external clock test mode

A test mode is available which allows for on-board testing. In this mode, it is possible to set up test conditions and control the operation of the RTC.

The test mode is entered by setting bit EXT_TEST in register Control_1. Then pin CLKOUT becomes an input. The test mode replaces the internal clock signal with the signal applied to pin CLKOUT.

The signal applied to pin CLKOUT should have a minimum pulse width of 300 ns and a maximum period of 1 000 ns. The internal clock, now sourced from CLKOUT, is divided down to 1 Hz by a 2⁶ divide chain called a prescaler. The prescaler can be set into a known state by using bit STOP. When bit STOP is set, the prescaler is reset to 0. (STOP must be cleared before the prescaler can operate again.)

From a stop condition, the first 1 second increment will take place after 32 positive edges on pin CLKOUT. Thereafter, every 64 positive edges cause a 1 second increment.

Remark: Entry into test mode is not synchronized to the internal 64 Hz clock. When entering the test mode, no assumption as to the state of the prescaler can be made.

Operation example:

1. Set EXT_TEST test mode (register Control_1, bit EXT_TEST = 1).
2. Set STOP (register Control_1, bit STOP = 1).
3. Clear STOP (register Control_1, bit STOP = 0).
4. Set time registers to desired value.
5. Apply 32 clock pulses to pin CLKOUT.
6. Read time registers to see the first change.
7. Apply 64 clock pulses to pin CLKOUT.
8. Read time registers to see the second change.

Repeat 7 and 8 for additional increments.

7.2.1.2 STOP: STOP bit function

The function of the STOP bit (see [Figure 4](#)) is to allow for accurate starting of the time circuits. The STOP bit function causes the upper part of the prescaler (F₂ to F₁₄) to be held in reset and thus no 1 Hz ticks are generated. It also stops the output of clock frequencies below 8 kHz on pin CLKOUT.

The time circuits can then be set and do not increment until the STOP bit is released (see [Figure 5](#) and [Table 6](#)).

Table 6. First increment of time circuits after STOP bit release

Bit	Prescaler bits	[1]	1 Hz tick	Time	Comment
STOP	F ₀ F ₁ -F ₂ to F ₁₄			hh:mm:ss	
Clock is running normally					
0	01-0 0001 1101 0100			12:45:12	prescaler counting normally
STOP bit is activated by user. F ₀ F ₁ are not reset and values cannot be predicted externally					

Table 6. First increment of time circuits after STOP bit release...continued

Bit	Prescaler bits	[1]	1 Hz tick	Time	Comment
STOP	F ₀ F ₁ -F ₂ to F ₁₄			hh:mm:ss	
1	XX-0 0000 0000 0000			12:45:12	prescaler is reset; time circuits are frozen
New time is set by user					
1	XX-0 0000 0000 0000			08:00:00	prescaler is reset; time circuits are frozen
STOP bit is released by user					
0	XX-0 0000 0000 0000			08:00:00	prescaler is now running
	XX-1 0000 0000 0000			08:00:00	-
	XX-0 1000 0000 0000			08:00:00	-
	XX-1 1000 0000 0000			08:00:00	-
	:			:	:
	11-1 1111 1111 1110			08:00:00	-
	00-0 0000 0000 0001			08:00:01	0 to 1 transition of F ₁₄ increments the time circuits
	10-0 0000 0000 0001			08:00:01	-
	:			:	:
	11-1 1111 1111 1111			08:00:01	-
	00-0 0000 0000 0000			08:00:01	-
	10-0 0000 0000 0000			08:00:01	-
	:			:	:
	11-1 1111 1111 1110			08:00:01	-
	00-0 0000 0000 0001			08:00:02	0 to 1 transition of F ₁₄ increments the time circuits

[1] F₀ is clocked at 32.768 kHz.

The lower two stages of the prescaler (F₀ and F₁) are not reset. And because the I²C-bus is asynchronous to the crystal oscillator, the accuracy of restarting the time circuits is between zero and one 8.192 kHz cycle (see [Figure 5](#)).

The first increment of the time circuits is between 0.507 813 s and 0.507 935 s after STOP bit is released. The uncertainty is caused by the prescaler bits F₀ and F₁ not being reset (see Table 6) and the unknown state of the 32 kHz clock.

7.2.1.3 Software reset

A reset is automatically generated at power-on. A reset can also be initiated with the software reset command. Software reset command means setting bits 6, 4, and 3 in register Control_1 (00h) logic 1 and all other bits logic 0 by sending the bit sequence 0101 1000 (58h), see Figure 6.

After sending the software reset command, it is recommended to re-initialize the interface by a STOP and START.

In reset state, all registers are set according to Table 7 and the address pointer returns to address 00h.

Table 7. Registers reset values

Address	Register name	Bit							
		7	6	5	4	3	2	1	0
00h	Control_1	0	0	0	0	0	0	0	0
01h	Control_2	0	0	0	0	0	0	0	0
02h	Offset	0	0	0	0	0	0	0	0
03h	RAM_byte	0	0	0	0	0	0	0	0

		0 ^[1]	no timer interrupt generated	
		1	flag set when timer interrupt generated	

Table 8. Control_2 - control and status register 2 (address 01h) bit description...continued

Bit	Symbol	Value	Description	Reference
2 to 0	COF[2:0]	see Table 10	CLKOUT control	Section 7.2.2.4

[1] Default value.

7.2.2.1 Alarm interrupt

AIE

This bit activates or deactivates the generation of an interrupt when AF is asserted, respectively.

AF

When an alarm occurs, AF is set logic 1. This bit maintains its value until overwritten by command. To prevent one flag being overwritten while clearing another, a logic AND is performed during a write access.

7.2.2.2 MI and HMI: minute and half minute interrupt

The minute interrupt (bit MI) and half minute interrupt (bit HMI) are pre-defined timers for generating interrupt pulses on pin INT; see Figure 8. The timers are running in sync with the seconds counter (see Table 18).

The minute and half minute interrupts must only be used when the frequency offset is set to normal mode (MODE = 0), see Section 7.2.3. In normal mode, the interrupt pulses on pin INT are 1/64 s wide.

When starting MI, the first interrupt will be generated after 1 second to 59 seconds. When starting HMI, the first interrupt will be generated after 1 second to 29 seconds. Subsequent periods do not have such a delay. The timers can be enabled independently from one another. However, a minute interrupt enabled on top of a half minute interrupt is not distinguishable.

Table 9. Effect of bits MI and HMI on INT generation

Minute interrupt (bit MI)	Half minute interrupt (bit HMI)	Result
0	0	no interrupt generated
1	0	an interrupt every minute
0	1	an interrupt every 30 s
1	1	an interrupt every 30 s

The duration of the timer is affected by the register Offset (see Section 7.2.3). Only when OFFSET[6:0] has the value 00h the periods are consistent.

7.2.2.3 TF: timer flag

The timer flag (bit TF) is set logic 1 on the first trigger of MI, HMI, or the countdown timer. The purpose of the flag is to allow the controlling system to interrogate what caused the interrupt: timer or alarm. The flag can be read and cleared by command.

The status of the timer flag TF can affect the INT pulse generation depending on the setting of TI_TP (see Section 7.6.2):

- When TI_TP is set logic 1
 - an INT pulse is generated independent of the status of the timer flag TF
 - TF stays set until it is cleared
 - TF does not affect INT

- the countdown timer runs in a repetitive loop and keeps generating timed periods
- When TI_TP is set logic 0
 - the $\overline{\text{INT}}$ generation follows the TF flag
 - TF stays set until it is cleared
 - If TF is not cleared before the next coming interrupt, no $\overline{\text{INT}}$ is generated
 - the countdown timer stops after the first countdown

7.2.2.4 COF[2:0]: Clock output frequency

A programmable square wave is available at pin CLKOUT. Operation is controlled by the COF[2:0] bits in the register Control_2. Frequencies of 32.768 kHz (default) down to 1 Hz can be generated for use as a system clock, microcontroller clock, input to a charge pump, or for calibration of the oscillator.

Pin CLKOUT is a push-pull output and enabled at power-on. CLKOUT can be disabled by setting COF[2:0] to 111. When disabled, the CLKOUT is LOW.

The duty cycle of the selected clock is not controlled. However, due to the nature of the clock generation, all clock frequencies except 32.768 kHz have a duty cycle of 50 : 50.

The STOP bit function can also affect the CLKOUT signal, depending on the selected frequency. When the STOP bit is set logic 1, the CLKOUT pin generates a continuous LOW for those frequencies that can be stopped. For more details of the STOP bit function, see [Section 7.2.1.2](#).

Table 10. CLKOUT frequency selection

COF[2:0]	CLKOUT frequency (Hz)	Typical duty cycle ^[1]	Effect of STOP bit
000 ^[2]	32 768	60 : 40 to 40 : 60	no effect
001	16 384	50 : 50	no effect
010	8 192	50 : 50	no effect
011	4 096	50 : 50	CLKOUT = LOW
100	2 048	50 : 50	CLKOUT = LOW
101	1 024	50 : 50	CLKOUT = LOW
110	1 ^[3]	50 : 50	CLKOUT = LOW
111	CLKOUT = LOW	-	-

[1] Duty cycle definition: % HIGH-level time : % LOW-level time.

[2] Default value.

[3] 1 Hz clock pulses are affected by offset correction pulses.

7.2.3 Register Offset

The PCA85073A incorporates an offset register (address 02h) which can be used to implement several functions, such as:

- Accuracy tuning
- Aging adjustment
- Temperature compensation

Table 11. Offset - offset register (address 02h) bit description

Bit	Symbol	Value	Description
7	MODE		offset mode
		0 ^[1]	normal mode: offset is made once every two hours

Table 11. Offset - offset register (address 02h) bit description...continued

Bit	Symbol	Value	Description
		1	course mode: offset is made every 4 minutes
6 to 0	OFFSET[6:0]	see Table 12	offset value

[1] Default value.

For MODE = 0, each LSB introduces an offset of 4.34 ppm. For MODE = 1, each LSB introduces an offset of 4.069 ppm. The offset value is coded in two's complement giving a range of +63 LSB to -64 LSB.

Table 12. Offset values

OFFSET[6:0]	Offset value in decimal	Offset value in ppm	
		Normal mode MODE = 0	Fast mode MODE = 1
011 1111	+63	+273.420	+256.347
011 1110	+62	+269.080	+252.278
:	:	:	:
000 0010	+2	+8.680	+8.138
000 0001	+1	+4.340	+4.069
000 0000 ^[1]	0	0 ^[1]	0 ^[1]
111 1111	-1	-4.340	-4.069
111 1110	-2	-8.680	-8.138
:	:	:	:
100 0001	-63	-273.420	-256.347
100 0000	-64	-277.760	-260.416

[1] Default value.

The correction is made by adding or subtracting clock correction pulses, thereby changing the period of a single second but not by changing the oscillator frequency.

It is possible to monitor when correction pulses are applied. To enable correction interrupt generation, bit CIE (register Control_1) has to be set logic 1. At every correction cycle, a pulse is generated on pin INT. The pulse width depends on the correction mode. If multiple correction pulses are applied, an interrupt pulse is generated for each correction pulse applied.

7.2.3.1 Correction when MODE = 0

The correction is triggered once every two hours and then correction pulses are applied once per minute until the programmed correction values have been implemented.

Table 13. Correction pulses for MODE = 0

Correction value	Update every n th hour	Minute	Correction pulses on INT per minute ^[1]
+1 or -1	2	00	1
+2 or -2	2	00 and 01	1
+3 or -3	2	00, 01, and 02	1

Table 13. Correction pulses for MODE = 0...continued

Correction value	Update every n th hour	Minute	Correction pulses on INT per minute ^[1]
:	:	:	:
+59 or -59	2	00 to 58	1
+60 or -60	2	00 to 59	1
+61 or -61	2	00 to 59	1
	2nd and next hour	00	1
+62 or -62	2	00 to 59	1
	2nd and next hour	00 and 01	1
+63 or -63	02	00 to 59	1
	2nd and next hour	00, 01, and 02	1
-64	02	00 to 59	1
	2nd and next hour	00, 01, 02, and 03	1

[1] The correction pulses on pin INT are $\frac{1}{64}$ s wide.

In MODE = 0, any timer or clock output using a frequency below 64 Hz is affected by the clock correction (see [Table 14](#)).

Table 14. Effect of correction pulses on frequencies for MODE = 0

Frequency (Hz)	Effect of correction
CLKOUT	
32 768	no effect
16 384	no effect
8 192	no effect
4 096	no effect
2 048	no effect
1 024	no effect
1	affected
Timer source clock	
4 096	no effect
64	no effect
1	affected
$\frac{1}{60}$	affected

7.2.3.2 Correction when MODE = 1

The correction is triggered once every four minutes and then correction pulses are applied once per second up to a maximum of 60 pulses. When correction values greater than 60 pulses are used, additional correction pulses are made in the 59th second.

Clock correction is made more frequently in MODE = 1; however, this can result in higher power consumption.

Table 15. Correction pulses for MODE = 1

Correction value	Update every n th minute	Second	Correction pulses on INT per second ^[1]
+1 or -1	4	00	1
+2 or -2	4	00 and 01	1
+3 or -3	4	00, 01, and 02	1
:	:	:	:
+59 or -59	4	00 to 58	1
+60 or -60	4	00 to 59	1
+61 or -61	4	00 to 58	1
	4	59	2
+62 or -62	4	00 to 58	1
	4	59	3
+63 or -63	4	00 to 58	1
	4	59	4
-64	4	00 to 58	1
	4	59	5

[1] The correction pulses on pin INT are $\frac{1}{1\,024}$ s wide. For multiple pulses, they are repeated at an interval of $\frac{1}{512}$ s.

In MODE = 1, any timer source clock using a frequency below 1.024 kHz is also affected by the clock correction (see [Table 16](#)).

Table 16. Effect of correction pulses on frequencies for MODE = 1

Frequency (Hz)	Effect of correction
CLKOUT	
32 768	no effect
16 384	no effect
8 192	no effect
4 096	no effect
2 048	no effect
1 024	no effect
1	affected
Timer source clock	
4 096	no effect
64	affected
1	affected
$\frac{1}{60}$	affected

7.2.3.3 Offset calibration workflow

The calibration offset has to be calculated based on the time. [Figure 9](#) shows the workflow how the offset register values can be calculated:

Figure 9. Offset calibration calculation workflow

With the offset calibration an accuracy of ± 2 ppm ($0.5 \times$ offset per LSB) can be reached (see [Table 12](#)).

± 1 ppm corresponds to a time deviation of 0.0864 seconds per day.

1. 3 correction pulses in MODE = 0 correspond to -13.02 ppm.
2. 4 correction pulses in MODE = 1 correspond to -16.276 ppm.
3. Reachable accuracy zone.

Figure 10. Result of offset calibration

7.2.4 Register RAM_byte

The PCA85073A provides a free RAM byte, which can be used for any purpose, for example, status byte of the system.

Table 17. RAM_byte - 8-bit RAM register (address 03h) bit description

Bit	Symbol	Value	Description
7 to 0	B[7:0]	0000 0000 ^[1] to 1111 1111	RAM content

[1] Default value.

7.3 Time and date registers

Most of the registers are coded in the BCD format to simplify application use.

7.3.1 Register Seconds

Table 18. Seconds - seconds register (address 04h) bit description

Bit	Symbol	Value	Place value	Description
7	OS			oscillator stop
		0	-	clock integrity is guaranteed
		1 ^[1]	-	clock integrity is not guaranteed; oscillator has stopped or has been interrupted
6 to 4	SECONDS	0 ^[1] to 5	ten's place	actual seconds coded in BCD format, see Table 19
3 to 0		0 ^[1] to 9	unit place	

[1] Default value.

Table 19. Seconds coded in BCD format

Seconds value in decimal	Upper-digit (ten's place)			Digit (unit place)			
	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
00 ^[1]	0	0	0	0	0	0	0
01	0	0	0	0	0	0	1
02	0	0	0	0	0	1	0
:	:	:	:	:	:	:	:
09	0	0	0	1	0	0	1
10	0	0	1	0	0	0	0
:	:	:	:	:	:	:	:
58	1	0	1	1	0	0	0
59	1	0	1	1	0	0	1

[1] Default value.

7.3.1.1 OS: Oscillator stop

When the oscillator of the PCA85073A is stopped, the OS flag is set. The oscillator can be stopped, for example, by connecting one of the oscillator pins OSCI or OSCO to ground. The oscillator is considered to be stopped during the time between power-on and stable crystal resonance. This time can be in the range of 200 ms to 2 s depending on crystal type, temperature, and supply voltage.

The flag remains set until cleared by command (see [Figure 11](#)). If the flag cannot be cleared, then the oscillator is not running. This method can be used to monitor the oscillator and to determine if the supply voltage has reduced to the point where oscillation fails.

7.3.2 Register Minutes

Table 20. Minutes - minutes register (address 05h) bit description

Bit	Symbol	Value	Place value	Description
7	-	0	-	unused
6 to 4	MINUTES	0 ^[1] to 5	ten's place	actual minutes coded in BCD format
3 to 0		0 ^[1] to 9	unit place	

[1] Default value.

7.3.3 Register Hours

Table 21. Hours - hours register (address 06h) bit description

Bit	Symbol	Value	Place value	Description
7 to 6	-	00	-	unused
12-hour mode ^[1]				
5	AMPM			AM/PM indicator
		0 ^[2]	-	AM
		1	-	PM
4	HOURS	0 ^[2] to 1	ten's place	actual hours in 12-hour mode coded in BCD format
3 to 0		0 ^[2] to 9	unit place	
24-hour mode ^[1]				
5 to 4	HOURS	0 ^[2] to 2	ten's place	actual hours in 24-hour mode coded in BCD format

Table 21. Hours - hours register (address 06h) bit description...continued

Bit	Symbol	Value	Place value	Description
3 to 0		0 ^[2] to 9	unit place	

[1] Hour mode is set by the 12_24 bit in register Control_1.
[2] Default value.

7.3.4 Register Days

Table 22. Days - days register (address 07h) bit description

Bit	Symbol	Value	Place value	Description
7 to 6	-	00	-	unused
5 to 4	DAYS ^[1]	0 ^[2] to 3	ten's place	actual day coded in BCD format
3 to 0		0 ^[3] to 9	unit place	

[1] If the year counter contains a value, which is exactly divisible by 4 (including the year 00), the PCA85073A compensates for leap years by adding a 29th day to February.
[2] Default value.
[3] Default value is 1.

7.3.5 Register Weekdays

Table 23. Weekdays - weekdays register (address 08h) bit description

Bit	Symbol	Value	Description
7 to 3	-	0000 0	unused
2 to 0	WEEKDAYS	0 to 6	actual weekday values, see Table 24

Table 24. Weekday assignments

Day ^[1]	Bit		
	2	1	0
Sunday	0	0	0
Monday	0	0	1
Tuesday	0	1	0
Wednesday	0	1	1
Thursday	1	0	0
Friday	1	0	1
Saturday ^[2]	1	1	0

[1] Definition may be reassigned by the user.
[2] Default value.

7.3.6 Register Months

Table 25. Months - months register (address 09h) bit description

Bit	Symbol	Value	Place value	Description
7 to 5	-	000	-	unused

Table 25. Months - months register (address 09h) bit description...continued

Bit	Symbol	Value	Place value	Description
4	MONTHS	0 to 1	ten's place	actual month coded in BCD format, see Table 26
3 to 0		0 to 9	unit place	

Table 26. Month assignments in BCD format

Month	Upper-digit (ten's place)	Digit (unit place)			
	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
January ^[1]	0	0	0	0	1
February	0	0	0	1	0
March	0	0	0	1	1
April	0	0	1	0	0
May	0	0	1	0	1
June	0	0	1	1	0
July	0	0	1	1	1
August	0	1	0	0	0
September	0	1	0	0	1
October	1	0	0	0	0
November	1	0	0	0	1
December	1	0	0	1	0

[1] Default value.

7.3.7 Register Years

Table 27. Years - years register (0Ah) bit description

Bit	Symbol	Value	Place value	Description
7 to 4	YEARS	0 ^[1] to 9	ten's place	actual year coded in BCD format
3 to 0		0 ^[1] to 9	unit place	

[1] Default value.

7.4 Setting and reading the time

[Figure 12](#) shows the data flow and data dependencies starting from the 1 Hz clock tick.

Figure 12. Data flow for the time function

During read/write operations, the time counting circuits (memory locations 04h through 0Ah) are blocked.

The blocking prevents

- Faulty reading of the clock and calendar during a carry condition
- Incrementing the time registers during the read cycle

After this read/write access is completed, the time circuit is released again and any pending request to increment the time counters that occurred during the read/write access is serviced. A maximum of 1 request can be stored; therefore, all accesses must be completed within 1 second (see Figure 13).

Figure 13. Access time for read/write operations

Because of this method, it is very important to make a read or write access in one go, that is, setting or reading seconds through to years should be made in one single access. Failing to comply with this method could result in the time becoming corrupted.

As an example, if the time (seconds through to hours) is set in one access and then in a second access the date is set, it is possible that the time will increment between the two accesses. A similar problem exists when reading. A roll-over may occur between reads thus giving the minutes from one moment and the hours from the next.

Recommended method for reading the time:

1. Send a START condition and the target address (see Table 38) for write (A2h)
2. Set the address pointer to 4 (Seconds) by sending 04h
3. Send a RESTART condition or STOP followed by START
4. Send the target address for read (A3h)
5. Read Seconds
6. Read Minutes

- 7. Read Hours
- 8. Read Days
- 9. Read Weekdays
- 10. Read Months
- 11. Read Years
- 12. Send a STOP condition

7.5 Alarm registers

7.5.1 Register Second_alarm

Table 28. Second_alarm - second alarm register (address 0Bh) bit description

Bit	Symbol	Value	Place value	Description
7	AEN_S			second alarm
		0	-	enabled
		1 ^[1]	-	disabled
6 to 4	SECOND_ALARM	0 ^[1] to 5	ten's place	second alarm information coded in BCD format
3 to 0		0 ^[1] to 9	unit place	

[1] Default value.

7.5.2 Register Minute_alarm

Table 29. Minute_alarm - minute alarm register (address 0Ch) bit description

Bit	Symbol	Value	Place value	Description
7	AEN_M			minute alarm
		0	-	enabled
		1 ^[1]	-	disabled
6 to 4	MINUTE_ALARM	0 ^[1] to 5	ten's place	minute alarm information coded in BCD format
3 to 0		0 ^[1] to 9	unit place	

[1] Default value.

7.5.3 Register Hour_alarm

Table 30. Hour_alarm - hour alarm register (address 0Dh) bit description

Bit	Symbol	Value	Place value	Description
7	AEN_H			hour alarm
		0	-	enabled
		1 ^[1]	-	disabled
6	-	0	-	unused
12-hour mode ^[2]				
5	AMPM			AM/PM indicator
		0 ^[1]	-	AM
		1	-	PM

Table 30. Hour_alarm - hour alarm register (address 0Dh) bit description...continued

Bit	Symbol	Value	Place value	Description
4	HOUR_ALARM	0 ^[1] to 1	ten's place	hour alarm information in 12-hour mode coded in BCD format
3 to 0		0 ^[1] to 9	unit place	
24-hour mode ^[2]				
5 to 4	HOUR_ALARM	0 ^[1] to 2	ten's place	hour alarm information in 24-hour mode coded in BCD format
3 to 0		0 ^[1] to 9	unit place	

[1] Default value.

[2] Hour mode is set by the 12_24 bit in register Control_1.

7.5.4 Register Day_alarm

Table 31. Day_alarm - day alarm register (address 0Eh) bit description

Bit	Symbol	Value	Place value	Description
7	AEN_D			day alarm
		0	-	enabled
		1 ^[1]	-	disabled
6	-	0	-	unused
5 to 4	DAY_ALARM	0 ^[1] to 3	ten's place	day alarm information coded in BCD format
3 to 0		0 ^[1] to 9	unit place	

[1] Default value.

7.5.5 Register Weekday_alarm

Table 32. Weekday_alarm - weekday alarm register (address 0Fh) bit description

Bit	Symbol	Value	Description
7	AEN_W		weekday alarm
		0	enabled
		1 ^[1]	disabled
6 to 3	-	0	unused
2 to 0	WEEKDAY_ALARM	0 ^[1] to 6	weekday alarm information coded in BCD format

[1] Default value.

7.5.6 Alarm function

By clearing the alarm enable bit (AEN_x) of one or more of the alarm registers, the corresponding alarm condition(s) are active. When an alarm occurs, AF is set logic 1. The asserted AF can be used to generate an interrupt (INT). The AF is cleared by command.

The registers at addresses 0Bh through 0Fh contain alarm information. When one or more of these registers is loaded with second, minute, hour, day or weekday, and its corresponding AEN_x is logic 0, then that information is compared with the current second, minute, hour, day, and weekday. When all enabled comparisons first match, the alarm flag (AF in register Control_2) is set logic 1.

The generation of interrupts from the alarm function is controlled via bit AIE. If bit AIE is enabled, the $\overline{\text{INT}}$ pin follows the condition of bit AF. AF remains set until cleared by command. Once AF has been cleared, it will only be set again when the time increments to match the alarm condition once more. Alarm registers which have their AEN_x bit at logic 1 are ignored.

7.6 Timer registers

The 8-bit countdown timer at address 10h is controlled by the register Timer_mode at address 11h.

7.6.1 Register Timer_value

Table 33. Timer_value - timer value register (address 10h) bit description

Bit	Symbol	Value	Description
7 to 0	T[7:0]	0h ^[1] to FFh	countdown timer value ^[2]

[1] Default value.

[2] Countdown period in seconds: $CountdownPeriod = \frac{T}{SourceClockFrequency}$ where T is the countdown value.

7.6.2 Register Timer_mode

Table 34. Timer_mode - timer control register (address 11h) bit description

Bit	Symbol	Value	Description
7 to 5	-	000	unused
4 to 3	TCF[1:0]		timer clock frequency
		00	4.096 kHz timer source clock
		01	64 Hz timer source clock
		10	1 Hz timer source clock
		11 ^[1]	$\frac{1}{60}$ Hz timer source clock
2	TE		timer enable
		0 ^[1]	timer is disabled
		1	timer is enabled
1	TIE		timer interrupt enable
		0 ^[1]	no interrupt generated from timer
		1	interrupt generated from timer
0	TI_TP ^[2]		timer interrupt mode
		0 ^[1]	interrupt follows timer flag
		1	interrupt generates a pulse

[1] Default value.

[2] How the setting of TI_TP and the timer flag TF can affect the $\overline{\text{INT}}$ pulse generation is explained in [Section 7.2.2.3](#).

7.6.3 Timer functions

The timer has four selectable source clocks allowing for countdown periods in the range from 244 μ s to 4 hours 15 min. For periods longer than 4 hours, the alarm function can be used.

Table 35. Timer clock frequency and timer durations

TCF[1:0]	Timer source clock frequency ^[1]	Delay	
		Minimum timer duration T = 1	Maximum timer duration T = 255
00	4.096 kHz	244 μ s	62.256 ms
01	64 Hz	15.625 ms	3.984 s
10	1 Hz ^[2]	1 s	255 s
11	$\frac{1}{60}$ Hz ^[2]	60 s	4 hours 15 min

[1] When not in use, TCF[1:0] must be set to $\frac{1}{60}$ Hz for power saving.

[2] Time periods can be affected by correction pulses.

Remark: Note that all timings which are generated from the 32.768 kHz oscillator are based on the assumption that there is 0 ppm deviation. Deviation in oscillator frequency results in deviation in timings. This is not applicable to interface timing.

The timer counts down from a software-loaded 8-bit binary value, T[7:0], in register Timer_value. Loading the counter with 0 stops the timer. Values from 1 to 255 are valid.

When the counter decrements from 1, the timer flag (bit TF in register Control_2) is set and the counter automatically re-loads and starts the next timer period.

If a new value of T is written before the end of the current timer period, then this value takes immediate effect. NXP does not recommend changing T without first disabling the counter by setting bit TE logic 0. The update of T is asynchronous to the timer clock. Therefore changing it without setting bit TE logic 0 may result in a corrupted value loaded into the countdown counter. This results in an undetermined countdown period for the first period. The countdown value T will, however, be correctly stored and correctly loaded on subsequent timer periods.

When the TIE flag is set, an interrupt signal on $\overline{\text{INT}}$ is generated if this mode is enabled. See [Section 7.2.2](#) for details on how the interrupt can be controlled.

When starting the timer for the first time, the first period has an uncertainty. The uncertainty is a result of the enable instruction being generated from the interface clock which is asynchronous from the timer source clock. Subsequent timer periods do not have such delay. The amount of delay for the first timer period depends on the chosen source clock, see [Table 36](#).

Table 36. First period delay for timer counter value T

Timer source clock	Minimum timer period	Maximum timer period
4.096 kHz	T	T + 1
64 Hz	T	T + 1
1 Hz	$(T - 1) + \frac{1}{64\text{Hz}}$	$T + \frac{1}{64\text{Hz}}$
$\frac{1}{60}$ Hz	$(T - 1) + \frac{1}{64\text{Hz}}$	$T + \frac{1}{64\text{Hz}}$

At the end of every countdown, the timer sets the countdown timer flag (bit TF in register Control_2). Bit TF can only be cleared by command. The asserted bit TF can be used to generate an interrupt at pin $\overline{\text{INT}}$. The interrupt may be generated as a pulsed signal every countdown period or as a permanently active signal which follows the condition of bit TF. Bit TI_TP is used to control this mode selection and the interrupt output may be disabled with bit TIE, see [Table 34](#) and [Figure 15](#).

When reading the timer, the current countdown value is returned and **not** the initial value T. Since it is not possible to freeze the countdown timer counter during read back, it is recommended to read the register twice and check for consistent results.

Timer source clock frequency selection of 1 Hz and 1/60 Hz is affected by the Offset register. The duration of a program period varies according to when the offset is initiated. For example, if a 100 s timer is set using the 1 Hz clock as source, then some 100 s periods will contain correction pulses and therefore be longer or shorter depending on the setting of the Offset register. See [Section 7.2.3](#) to understand the operation of the Offset register.

7.6.3.1 Countdown timer interrupts

The pulse generator for the countdown timer interrupt uses an internal clock and is dependent on the selected source clock for the countdown timer and on the countdown value T. As a consequence, the width of the interrupt pulse varies (see [Table 37](#)).

Table 37. INT operation
TF and INT become active simultaneously.

Source clock (Hz)	INT period (s)	
	T = 1 ^[1]	T > 1 ^[1]
4 096	1/8 192	1/4 096
64	1/128	1/64
1	1/64	1/64
1/60	1/64	1/64

[1] T = loaded countdown value. Timer stops when T = 0.

8 Characteristics of the I²C-bus interface

The I²C-bus is for bidirectional, two-line communication between different ICs or modules. The two lines are a Serial Data line (SDA) and a Serial Clock line (SCL). Both lines must be connected to a positive supply via a pull-up resistor. Data transfer may be initiated only when the bus is not busy.

8.1 Bit transfer

One data bit is transferred during each clock pulse. The data on the SDA line must remain stable during the HIGH period of the clock pulse, as changes in the data line at this time are interpreted as a control signal (see [Figure 16](#)).

Figure 16. Bit transfer

8.2 START and STOP conditions

Both data and clock lines remain HIGH when the bus is not busy.

A HIGH-to-LOW transition of the data line while the clock is HIGH is defined as the START condition - S.

A LOW-to-HIGH transition of the data line while the clock is HIGH is defined as the STOP condition - P (see [Figure 17](#)).

Figure 17. Definition of START and STOP conditions

8.3 System configuration

A device generating a message is a transmitter; a device receiving a message is a receiver. The device that controls the message is the controller; and the devices which are controlled by the controller are the followers (see [Figure 18](#)).

Figure 18. System configuration

8.4 Acknowledge

The number of data bytes transferred between the START and STOP conditions from transmitter to receiver is unlimited. Each byte of 8 bits is followed by an acknowledge cycle.

- A target receiver, which is addressed, must generate an acknowledge after the reception of each byte
- Also a controller receiver must generate an acknowledge after the reception of each byte that has been clocked out of the target transmitter
- The device that acknowledges must pull-down the SDA line during the acknowledge clock pulse, so that the SDA line is stable LOW during the HIGH period of the acknowledge related clock pulse (set-up and hold times must be considered)
- A controller receiver must signal an end of data to the transmitter by not generating an acknowledge on the last byte that has been clocked out of the target. In this event, the transmitter must leave the data line HIGH to enable the controller to generate a STOP condition

Acknowledgement on the I²C-bus is shown in [Figure 19](#).

8.5 I²C-bus protocol

8.5.1 Addressing

One I²C-bus target address (1010 001) is reserved for the PCA85073A. The entire I²C-bus target address byte is shown in Table 38.

Table 38. I²C target address byte

Target address								
Bit	7	6	5	4	3	2	1	0
	MSB							LSB
	1	0	1	0	0	0	1	R/W

After a START condition, the I²C target address has to be sent to the PCA85073A device.

The R/W bit defines the direction of the following single or multiple byte data transfer (R/W = 0 for writing, R/W = 1 for reading). For the format and the timing of the START condition (S), the STOP condition (P) and the acknowledge bit (A) refer to the I²C-bus characteristics (see [2]). In the write mode, a data transfer is terminated by sending either the STOP condition or the START condition of the next data transfer.

8.5.2 Clock and calendar READ or WRITE cycles

The I²C-bus configuration for the different PCA85073A READ and WRITE cycles is shown in Figure 20 and Figure 21. The register address is a 5-bit value that defines which register is to be accessed next. The upper 3 bits of the register address are not used.

8.5.3 I²C-bus error recovery technique

Target devices like the PCA85073A use a state machine to implement the I²C protocol and expect a certain sequence of events to occur to function properly. Unexpected events at the I²C controller can wreak havoc with the followers connected on the bus. However, it is usually possible to recover deterministically to a known bus state with careful protocol manipulation.

A deterministic method to clear this situation if SDA is stuck LOW (it effectively blocks any other I²C-bus transaction, once the controller recognizes a 'stuck bus' state), is for the controller to blindly transmit nine clocks on SCL. If the target was transmitting data or acknowledging, nine or more clocks ensures the target state machine returns to a known, idle state since the protocol calls for eight data bits and one ACK bit. It does not matter when the target state machine finishes its transmission; extra clocks are recognized as STOP conditions.

With careful design of the bus controller error recovery firmware, many I²C-bus protocol problems can be avoided.

S/W considerations: NXP recommends customers allow for S/W reset capability to enable the bus error recovery technique. The 9-clock pulse method as described above involves a bus-controller capable of providing such a signal.

Further comments/additional information are available in [\[3\]](#) and [\[2\]"UM10204"](#).

9 Internal circuitry

10 Safety notes

CAUTION

This device is sensitive to ElectroStatic Discharge (ESD). Observe precautions for handling electrostatic sensitive devices.

Such precautions are described in the *ANSI/ESD S20.20*, *IEC/ST 61340-5*, *JESD625-A* or equivalent standards.

11 Limiting values

Table 39. Limiting values^[1]
In accordance with the Absolute Maximum Rating System (IEC 60134).

Symbol	Parameter	Conditions	Min	Max	Unit
V _{DD}	supply voltage		-0.5	+6.5	V
I _{DD}	supply current		-50	+50	mA
V _I	input voltage	on pins SCL, SDA, OSCI	-0.5	+6.5	V
V _O	output voltage		-0.5	+6.5	V
I _I	input current	at any input	-10	+10	mA
I _O	output current	at any output	-10	+10	mA
P _{tot}	total power dissipation		-	300	mW
T _{stg}	storage temperature		^[2] -65	+150	°C
T _{amb}	ambient temperature	operating device	-40	+105	°C

[1] Remark: The PCA85073A part is not guaranteed (nor characterized) above the operating range as denoted in the datasheet. NXP recommends not to bias the PCA85073A device during reflow (e.g. if utilizing a 'coin' type battery in the assembly). If customer so chooses to continue to use this assembly method, there must be the allowance for a full 'Q0 V' level Power supply 'Qreset' to re-enable the device. Without a proper POR, the device may remain in an indeterminate state.

[2] According to the store and transport requirements (see [4]) the devices have to be stored at a temperature of +8 °C to +45 °C and a humidity of 25 % to 75 %.

Automotive Tiny Real-Time Clock/Calendar with Alarm Function and I²C-Bus

Table 40. Static characteristics...continued

$V_{DD} = 0.9\text{ V to }5.5\text{ V}$; $V_{SS} = 0\text{ V}$; $T_{amb} = -40\text{ }^{\circ}\text{C to }+105\text{ }^{\circ}\text{C}$; $f_{osc} = 32.768\text{ kHz}$; quartz $R_s = 60\text{ k}\Omega$; $C_L = 7\text{ pF}$; unless otherwise specified.

Symbol	Parameter	Conditions		Min	Typ	Max	Unit
$\Delta f_{osc}/f_{osc}$	relative oscillator frequency variation	$\Delta V_{DD} = 200\text{ mV}$; $T_{amb} = 25\text{ }^{\circ}\text{C}$		-	0.075	-	ppm
$C_{L(itg)}$	integrated load capacitance	on pins OSC0, OSC1	[5]				
		$C_L = 7\text{ pF}$		4.2	7	9.8	pF
		$C_L = 12.5\text{ pF}$		7.5	12.5	17.5	pF
R_s	series resistance			-	-	100	k Ω

- [1] For reliable oscillator start-up at power-on use V_{DD} greater than 1.2 V. If powered up at 0.9 V the oscillator will start but it might be a bit slow, especially if at high temperature. Normally the power supply is not 0.9 V at start-up and only comes at the end of battery discharge. V_{DD} min of 0.9 V is specified so that the customer can calculate how large a battery or capacitor they need for their application. V_{DD} min of 1.2 V or greater is needed to ensure speedy oscillator start-up time. For a restart condition, NXP recommends a full '0 V' V_{DD} value upon re-biasing.
- [2] Timer source clock = $\frac{1}{60}$ Hz, level of pins SCL and SDA is V_{DD} or V_{SS} .
- [3] The I²C-bus interface of PCA85073A is 5 V tolerant.
- [4] Implicit by design.
- [5]

Integrated load capacitance, $C_{L(itg)}$, is a calculation of C_{OSC1} and C_{OSC0} in series: $C_{L(itg)} = \frac{(C_{OSCr}C_{OSCO})}{(C_{OSCr}+C_{OSCO})}$.

C_{L(itg)} = 7 pF; CLKOUT disabled.
1. V_{DD} = 5.5 V.
2. V_{DD} = 3.3 V.

Figure 24. When Control_1.CAP_SEL = 0b

C_{L(itg)} = 12.5 pF; CLKOUT disabled.
1. V_{DD} = 5.5 V.
2. V_{DD} = 3.3 V.

Figure 25. When Control_1.CAP_SEL = 1b

$T_{amb} = 25\text{ }^{\circ}\text{C}$; $f_{CLKOUT} = 32\,768\text{ Hz}$.

1. 47 pF CLKOUT load.
2. 22 pF CLKOUT load.

Figure 26. When Control_2.COF = 000b

$T_{amb} = 25\text{ }^{\circ}\text{C}$; CLKOUT disabled.

1. $C_{L(itg)} = 12.5\text{ pF}$.
2. $C_{L(itg)} = 7\text{ pF}$.

Figure 27. When Control_2.COF = 111b

Table 41. I²C-bus characteristics

$V_{DD} = 1.8\text{ V}$ to 5.5 V ; $V_{SS} = 0\text{ V}$; $T_{amb} = -40\text{ }^\circ\text{C}$ to $+105\text{ }^\circ\text{C}$; $f_{osc} = 32.768\text{ kHz}$; quartz $R_s = 60\text{ k}\Omega$; $C_L = 7\text{ pF}$; unless otherwise specified. All timing values are valid within the operating supply voltage and temperature range and referenced to V_{IL} and V_{IH} with an input voltage swing of V_{SS} to V_{DD} ^[1].

Symbol	Parameter	Conditions	Min	Max	Unit
C_b	capacitive load for each bus line		-	400	pF
f_{SCL}	SCL clock frequency		^[2] 0	400	kHz
$t_{HD,STA}$	hold time (repeated) START condition		0.6	-	μs

Table 41. I²C-bus characteristics...continued

$V_{DD} = 1.8\text{ V to }5.5\text{ V}$; $V_{SS} = 0\text{ V}$; $T_{amb} = -40\text{ °C to }+105\text{ °C}$; $f_{osc} = 32.768\text{ kHz}$; quartz $R_s = 60\text{ k}\Omega$; $C_L = 7\text{ pF}$; unless otherwise specified. All timing values are valid within the operating supply voltage and temperature range and referenced to V_{IL} and V_{IH} with an input voltage swing of V_{SS} to V_{DD} ^[1].

Symbol	Parameter	Conditions		Min	Max	Unit
$t_{SU,STA}$	set-up time for a repeated START condition			0.6	-	μs
t_{LOW}	LOW period of the SCL clock			1.3	-	μs
t_{HIGH}	HIGH period of the SCL clock			0.6	-	μs
t_r	rise time of both SDA and SCL signals			20	300	ns
t_f	fall time of both SDA and SCL signals		[3][4]	$20 \times (V_{DD} / 5.5\text{ V})$	300	ns
t_{BUF}	bus free time between a STOP and START condition			1.3	-	μs
$t_{SU,DAT}$	data set-up time			100	-	ns
$t_{HD,DAT}$	data hold time			0	-	ns
$t_{SU,STO}$	set-up time for STOP condition			0.6	-	μs
$t_{VD,DAT}$	data valid time			0	0.9	μs
$t_{VD,ACK}$	data valid acknowledge time			0	0.9	μs
t_{SP}	pulse width of spikes that must be suppressed by the input filter			0	50	ns

[1] A detailed description of the I²C-bus specification is given in [2].

[2] I²C-bus access time between two STARTs or between a START and a STOP condition to this device must be less than one second.

[3] A device must internally provide a hold time of at least 300 ns for the SDA signal (with respect to the $V_{IH(min)}$ of the SCL signal) to bridge the undefined region of the falling edge of SCL.

[4] The maximum t_f for the SDA and SCL bus lines is specified at 300 ns. The maximum fall time for the SDA output stage t_f is specified at 250 ns. This allows series protection resistors to be connected in between the SDA and the SCL pins and the SDA/SCL bus lines without exceeding the maximum specified t_f .

Figure 30. I²C-bus timing diagram; rise and fall times refer to 30 % and 70 %

13 Application information

A 1 farad super capacitor combined with a low V_F diode can be used as a standby or back-up supply. With the RTC in its minimum power configuration that is, timer off and CLKOUT off, the RTC may operate for weeks.

- 1. R1 limits the inrush current to the super capacitor at power-on.
- 2. NXP recommends tying V_{DD} of the device and V_{DD} of all the external pull-up resistors to the same Power Supply.
- 3. NXP also recommends the customer place accessible 'Pads/TP-test point' on the layout so as to enable a 'hard' grounding of the power supply V_{DD} in the event a full discharge cannot be attained.

Figure 31. Application diagram for PCA85073A

14 Test information

14.1 Quality information

This product has been qualified in accordance with the Automotive Electronics Council (AEC) standard Q100 - *Failure mechanism based stress test qualification for integrated circuits*, and is suitable for use in automotive applications.

15 Package outline

Figure 32. Package outline SOT505-1 (TSSOP8)

16 Handling information

All input and output pins are protected against ElectroStatic Discharge (ESD) under normal handling. When handling Metal-Oxide Semiconductor (MOS) devices ensure that all normal precautions are taken as described in JESD625-A, IEC 61340-5 or equivalent standards.

17 Packing information

17.1 Tape and reel information

For tape and reel packing information, please see [\[1\]](#).

18 Soldering of SMD packages

This text provides a very brief insight into a complex technology. A more in-depth account of soldering ICs can be found in Application Note AN10365 “*Surface mount reflow soldering description*”.

18.1 Introduction to soldering

Soldering is one of the most common methods through which packages are attached to Printed Circuit Boards (PCBs), to form electrical circuits. The soldered joint provides both the mechanical and the electrical connection. There is no single soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and Surface Mount Devices (SMDs) are mixed on one printed wiring board; however, it is not suitable for fine pitch SMDs. Reflow soldering is ideal for the small pitches and high densities that come with increased miniaturization.

18.2 Wave and reflow soldering

Wave soldering is a joining technology in which the joints are made by solder coming from a standing wave of liquid solder. The wave soldering process is suitable for the following:

- Through-hole components
- Leaded or leadless SMDs, which are glued to the surface of the printed circuit board

Not all SMDs can be wave soldered. Packages with solder balls, and some leadless packages which have solder lands underneath the body, cannot be wave soldered. Also, leaded SMDs with leads having a pitch smaller than ~0.6 mm cannot be wave soldered, due to an increased probability of bridging.

The reflow soldering process involves applying solder paste to a board, followed by component placement and exposure to a temperature profile. Leaded packages, packages with solder balls, and leadless packages are all reflow solderable.

Key characteristics in both wave and reflow soldering are:

- Board specifications, including the board finish, solder masks and vias
- Package footprints, including solder thieves and orientation
- The moisture sensitivity level of the packages
- Package placement
- Inspection and repair
- Lead-free soldering versus SnPb soldering

18.3 Wave soldering

Key characteristics in wave soldering are:

- Process issues, such as application of adhesive and flux, clinching of leads, board transport, the solder wave parameters, and the time during which components are exposed to the wave
- Solder bath specifications, including temperature and impurities

18.4 Reflow soldering

Key characteristics in reflow soldering are:

- Lead-free versus SnPb soldering; note that a lead-free reflow process usually leads to higher minimum peak temperatures (see [Figure 33](#)) than a SnPb process, thus reducing the process window
- Solder paste printing issues including smearing, release, and adjusting the process window for a mix of large and small components on one board
- Reflow temperature profile; this profile includes preheat, reflow (in which the board is heated to the peak temperature) and cooling down. It is imperative that the peak temperature is high enough for the solder to make reliable solder joints (a solder paste characteristic). In addition, the peak temperature must be low enough that the packages and/or boards are not damaged. The peak temperature of the package depends on package thickness and volume and is classified in accordance with [Table 42](#) and [Table 43](#)

Table 42. SnPb eutectic process (from J-STD-020D)

Package thickness (mm)	Package reflow temperature (°C)	
	Volume (mm ³)	
	< 350	≥ 350
< 2.5	235	220
≥ 2.5	220	220

Table 43. Lead-free process (from J-STD-020D)

Package thickness (mm)	Package reflow temperature (°C)		
	Volume (mm ³)		
	< 350	350 to 2000	> 2000
< 1.6	260	260	260
1.6 to 2.5	260	250	245
> 2.5	250	245	245

Moisture sensitivity precautions, as indicated on the packing, must be respected at all times.

Studies have shown that small packages reach higher temperatures during reflow soldering, see [Figure 33](#).

Figure 33. Temperature profiles for large and small components

For further information on temperature profiles, refer to Application Note AN10365 “Surface mount reflow soldering description”.

19 Footprint information

Figure 34. Footprint information for reflow soldering of SOT505-1 (TSSOP8)

20 Appendix

20.1 Real-Time Clock selection

Data sheet status

Document status ^{[1][2]}	Product status ^[3]	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

- [1] Please consult the most recently issued document before initiating or completing a design.
[2] The term 'short data sheet' is explained in section "Definitions".
[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL <https://www.nxp.com>.

Definitions

Draft — A draft status on a document indicates that the content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included in a draft version of a document and shall have no liability for the consequences of use of such information.

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

Product specification — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

Disclaimers

Limited warranty and liability — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms and conditions of commercial sale of NXP Semiconductors.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <https://www.nxp.com/profile/terms>, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

No offer to sell or license — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

Automotive Tiny Real-Time Clock/Calendar with Alarm Function and I²C-Bus

Suitability for use in automotive applications — This NXP product has been qualified for use in automotive applications. If this product is used by customer in the development of, or for incorporation into, products or services (a) used in safety critical applications or (b) in which failure could lead to death, personal injury, or severe physical or environmental damage (such products and services hereinafter referred to as “Critical Applications”), then customer makes the ultimate design decisions regarding its products and is solely responsible for compliance with all legal, regulatory, safety, and security related requirements concerning its products, regardless of any information or support that may be provided by NXP. As such, customer assumes all risk related to use of any products in Critical Applications and NXP and its suppliers shall not be liable for any such use by customer. Accordingly, customer will indemnify and hold NXP harmless from any claims, liabilities, damages and associated costs and expenses (including attorneys’ fees) that NXP may incur related to customer’s incorporation of any product in a Critical Application.

Quick reference data — The Quick reference data is an extract of the product data given in the Limiting values and Characteristics sections of this document, and as such is not complete, exhaustive or legally binding.

Export control — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

HTML publications — An HTML version, if available, of this document is provided as a courtesy. Definitive information is contained in the applicable document in PDF format. If there is a discrepancy between the HTML document and the PDF document, the PDF document has priority.

Translations — A non-English (translated) version of a document, including the legal information in that document, is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.

Security — Customer understands that all NXP products may be subject to unidentified vulnerabilities or may support established security standards or specifications with known limitations. Customer is responsible for the design and operation of its applications and products throughout their lifecycles to reduce the effect of these vulnerabilities on customer’s applications and products. Customer’s responsibility also extends to other open and/or proprietary technologies supported by NXP products for use in customer’s applications. NXP accepts no liability for any vulnerability. Customer should regularly check security updates from NXP and follow up appropriately.

Customer shall select products with security features that best meet rules, regulations, and standards of the intended application and make the ultimate design decisions regarding its products and is solely responsible for compliance with all legal, regulatory, and security related requirements concerning its products, regardless of any information or support that may be provided by NXP.

NXP has a Product Security Incident Response Team (PSIRT) (reachable at PSIRT@nxp.com) that manages the investigation, reporting, and solution release to security vulnerabilities of NXP products.

NXP B.V. — NXP B.V. is not an operating company and it does not distribute or sell products.

Trademarks

Notice: All referenced brands, product names, service names, and trademarks are the property of their respective owners.
