COMPONENTS

STRIPPING DIMENSIONS

We recommend a cable thermal preconditioning before assembly

1

For cables with a jacket, remove this one according to the quotation C before using the recommended tool.
Insert the cable into the clamping element.
Present the pointer in front of the clamping element.
Push the cable until it stops, while holding the clamping element pushed on the hollow part of the pointer.
Turn the clamping part until the release of the pointer.

2

Present the cutting element in front of the cutting element.
Push and turn both elements, back part opposite to the front part.
Once they reach the stop, pull without revolving.

3

Insert the cable into the body.
Secure the positioner into the assembly jig.
Place the sub-assembly into the assembly jig.
Tighten.

4

Put three rings of solder around the cable.
Solder the body onto the cable.

5

After cooling, remove the assembly from the jig.
Remove the positioner.
Solder the inner conductor.

6

Place the connector into the tool. Place the gasket and the cap into the body.
Press on the cap flush or slightly below the surface of the body assembly. Slide the sleeve over the body and heatshrink it in place.
