Mnemonic	Pin No.	Function	Description
Power and Ground			
DV _{GPIO} 3.3 V $\pm$ 10%	3	I	GPIO and S/PDIF Out (1 and 2) Signal Level (independent of DV _{IO}). Connect to 3.3 V $\pm$ 10%.

AV _{DD} 3.3 V $\pm$ 5%	25, 38	I	CAUTION: DO NOT APPLY 5.0 V TO THESE PINS! Analog Supply Voltage 3.3 V ONLY. Note: AV _{DD} supplies should be well regulated and filtered as supply noise degrades audio performance.
MIC_BIAS_IN	33	I	Source for Microphone Bias Circuitry. Connect this pin to 5.0 V via a low-pass filter. When connected this way the AD1989A is capable of providing +3.95 V as a mic bias to all of the MIC_BIAS pins. If 5 V is not available, connect this pin to +3.3 V (AV _{DD}) via a low-pass filter. The AD1989A produces a mic bias voltage relative to the AV _{DD} supply (typically 3.0 V @ AV _{DD} = 3.3 V).
AV _{SS}	26, 42	I	Analog Supply Return (Ground). AV _{SS} should be connected to DV _{SS} using a conductive trace under, or close to, the AD1989A.
GENERAL NOTES: 1. The symbols used in this table are defined as follows: I = Input O = Output LI = Line level input LO = Line level output HP = Output capable of driving headphone load MIC = Input supports microphones with MIC bias and boost amplifier SWAP = Outputs can swap L/R channels (typically used to support C/LFE or shared C/LFE function).			

1.7 Digital Microphone Interface Timing Specifications

The digital microphone interface can support one or two digital microphones using two or three codec pins. Both uniplex (one microphone per data pin) and multiplex (two microphones sharing the same data pin) are supported. The timing for these configurations is shown in [Figures 2 and 3](#). The interface can generate a microphone clock at 1.5 MHz, 2.0 MHz, or 3.0 MHz to suit quality and power requirements
