

Decoder/Demultiplexer

54F139

FEATURES

- Demultiplexing capability
- Two independent 1-of-4 decoders
- Multifunction capability

DESCRIPTION

The 54F139 is a high-speed, dual 1-of-4 decoder/demultiplexer. This device has two independent decoders, each accepting two binary weighted inputs (A0, A1) and providing four mutually exclusive active Low outputs (Q0n - Q3n). Each decoder has an active Low Enable (E). When E is High, every output is forced High. The Enable can be used as the Data input for a 1-of-4 demultiplexer application.

NOTES:

- For conditions shown as Min or Max, use the appropriate value specified under recommended operating conditions for the applicable type and function table for operating mode.
- All typical values are at V_{CC} = 5V, T_A = 25°C.
- Not more than one output should be shorted at a time. For testing I_{OS}, the use of high-speed test apparatus and/or sample-and-hold techniques are preferable in order to minimize internal heating and more accurately reflect operational values. Otherwise, prolonged shorting of a High output may raise the chip temperature well above normal and thereby cause invalid readings in other parameter tests. In any sequence of parameter tests, I_{OS} tests should be performed last.
- ... To measure I_{CC}, outputs must be open, V_{IH} on all inputs = 4.5V.
