

Rochester Electronics Manufactured Components

Rochester branded components are manufactured using either die/wafers purchased from the original suppliers or Rochester wafers recreated from the original IP. All recreations are done with the approval of the OCM.

Parts are tested using original factory test programs or Rochester developed test solutions to guarantee product meets or exceed the OCM data sheet.

Quality Overview

- ISO-9001
- AS9120 certification
- Qualified Manufacturers List (QML) MIL-PRF-35835
 - Class Q Military
 - Class V Space Level
- Qualified Suppliers List of Distributors (QSLD)
 - Rochester is a critical supplier to DLA and meets all industry and DLA standards.

Rochester Electronics, LLC is committed to supplying products that satisfy customer expectations for quality and are equal to those originally supplied by industry manufacturers.

The original manufacturer's datasheet accompanying this document reflects the performance and specifications of the Rochester manufactured version of this device. Rochester Electronics guarantees the performance of its semiconductor products to the original OEM specifications. 'Typical' values are for reference purposes only. Certain minimum or maximum ratings may be based on product characterization, design, simulation, or sample testing.

Microprocessor Supervisory Circuits in 3-Lead SC70 and SOT-23

ADM803/ADM809/ADM810

FEATURES

Specified over temperature
Low power consumption (17 μ A)
Precision voltage monitor: 2.5 V, 3 V, 3.3 V, 5 V options
Reset assertion down to 1 V V_{CC}
140 ms minimum power-on reset
Open-drain $\overline{\text{RESET}}$ output (ADM803)
Push-pull $\overline{\text{RESET}}$ output (ADM809)
Push-pull RESET output (ADM810)
SC70 and SOT-23 packages

APPLICATIONS

Microprocessor systems
Computers
Controllers
Intelligent instruments
Automotive systems

FUNCTIONAL BLOCK DIAGRAM

Figure 1.

GENERAL DESCRIPTION

The ADM803/ADM809/ADM810 supervisory circuits monitor the power supply voltage in microprocessor systems. They provide a reset output during power-up, power-down, and brownout conditions. On power-up, an internal timer holds reset asserted for 240 ms. This holds the microprocessor in a reset state until conditions have stabilized. The $\overline{\text{RESET}}$ output remains operational with V_{CC} as low as 1 V. The ADM803 and ADM809 provide an active low reset signal ($\overline{\text{RESET}}$), while the ADM810 provides an active high signal (RESET) output. The ADM809 and ADM810 have push-pull outputs, whereas the ADM803 has an open-drain output, which requires an external pull-up resistor.

Seven reset threshold voltage options are available, suitable for monitoring a variety of supply voltages (see Table 2).

The reset comparator features built-in glitch immunity, making it immune to fast transients on V_{CC} .

The ADM803/ADM809/ADM810 consume only 17 μ A, making them suitable for low power, portable equipment. The ADM803 is available in a 3-lead SC70; the ADM809/ADM810 are available in 3-lead SOT-23 and SC70 packages.

ADM8_Z	2.28	2.32	2.35	V	$T_A = 25^{\circ}\text{C}$
ADM8_Z	2.25		2.38	V	$T_A = -40^{\circ}\text{C}$ to $+85^{\circ}\text{C}$
ADM8_Z	2.22		2.42	V	$T_A = -40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$
RESET THRESHOLD TEMPERATURE COEFFICIENT		30		ppm/ $^{\circ}\text{C}$	
V_{CC} to Reset Delay		20		μs	$V_{CC} = V_{TH}$ to $(V_{TH} - 100\text{ mV})$
RESET ACTIVE TIMEOUT PERIOD	140	240	460	ms	$T_A = -40^{\circ}\text{C}$ to $+85^{\circ}\text{C}$
	100		840	ms	$T_A = 85^{\circ}\text{C}$ to 125°C
RESET OUTPUT VOLTAGE LOW (ADM803/ADM809)			0.3	V	$V_{CC} = V_{TH}$ min, $I_{SINK} = 1.2\text{ mA}$, ADM803R/S/T/Z, ADM809R/S/T/Z
			0.4	V	$V_{CC} = V_{TH}$ min, $I_{SINK} = 3.2\text{ mA}$, ADM803L/M/J, ADM809L/M/J
			0.3	V	$V_{CC} > 1.0\text{ V}$, $I_{SINK} = 50\text{ }\mu\text{A}$
RESET OUTPUT VOLTAGE HIGH (ADM809)	$0.8 V_{CC}$			V	$V_{CC} > V_{TH}$ max, $I_{SOURCE} = 500\text{ }\mu\text{A}$, ADM809R/S/T/Z
	$V_{CC} - 1.5$			V	$V_{CC} > V_{TH}$ max, $I_{SOURCE} = 800\text{ }\mu\text{A}$, ADM809L/M/J
RESET OUTPUT VOLTAGE LOW (ADM810)			0.3	V	$V_{CC} = V_{TH}$ min, $I_{SINK} = 1.2\text{ mA}$, ADM810R/S/T/Z
			0.4	V	$V_{CC} = V_{TH}$ min, $I_{SINK} = 3.2\text{ mA}$, ADM810L/M/J
RESET OUTPUT VOLTAGE HIGH (ADM810)	$0.8 V_{CC}$			V	$1.8\text{ V} < V_{CC} < V_{TH}$ min, $I_{SOURCE} = 150\text{ }\mu\text{A}$
RESET OPEN-DRAIN OUTPUT Leakage Current (ADM803)		1		μA	$V_{CC} > V_{TH}$, reset de-asserted

ADM803/ADM809/ADM810

ABSOLUTE MAXIMUM RATINGS

$T_A = 25^\circ\text{C}$, unless otherwise noted.

Table 1.

Parameter	Ratings
V_{CC}	-0.3 V to +6 V
RESET, $\overline{\text{RESET}}$	-0.3 V to $V_{CC} + 0.5$ V
Input Current V_{CC}	20 mA
Output Current RESET, $\overline{\text{RESET}}$ (push-pull)	20 mA
$\overline{\text{RESET}}$ (open drain)	-0.3 V to +6.0 V
Rate of Rise, V_{CC}	100 V/ μs
θ_{JA} Thermal Impedance, SC70	146°C/W
θ_{JA} Thermal Impedance, SOT-23	270°C/W
Lead Temperature (Soldering, 10 sec)	300°C
Vapor Phase (60 sec)	215°C
Infrared (15 sec)	220°C
Storage Temperature Range	-65°C to +150°C

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

Table 2. Reset Threshold Options

RESET Model	Threshold (V)
ADM8_L	4.63
ADM8_M	4.38
ADM8_J (ADM809/ADM810 only)	4.00
ADM8_T	3.08
ADM8_S	2.93
ADM8_R	2.63
ADM8_Z	2.32

INTERFACING TO OTHER DEVICES' OUTPUT

The ADM803/ADM809/ADM810 series is designed to integrate with as many devices as possible and, therefore, has a standard output dependent on V_{CC} . This enables the parts to be used in both 3 V and 5 V, or any nominal voltage within the minimum and maximum specifications for V_{CC} . This design simplifies interfacing the ADM803/ADM809/ADM810 to other devices.

ENSURING A VALID RESET OUTPUT DOWN TO $V_{CC} = 0$ V

When V_{CC} falls below 0.8 V, the ADM803/ADM809 RESET no longer sinks current. A high impedance CMOS logic input connected to RESET may, therefore, drift to undetermined logic levels. To eliminate this problem, a 100 k Ω resistor should be connected from RESET to ground.

Figure 11. Ensuring a Valid Reset Output Down to $V_{CC} = 0$ V

BENEFITS OF AN ACCURATE RESET THRESHOLD

In other microprocessors, tolerances in supply voltages lead to an overall increase in reset tolerance levels due to the deterioration of the reset circuit's power supply. In the ADM803/ADM809/ADM810, the possibility of a malfunction during a power failure is greatly reduced because the devices can operate effectively even when there are large degradations of the supply voltages. Another advantage is the very accurate internal voltage reference circuit of the ADM803/ADM809/ADM810. These benefits combine to produce an exceptionally reliable voltage monitor circuit.

INTERFACING TO MICROPROCESSORS WITH MULTIPLE INTERRUPTS

In a number of cases, it is necessary to interface many interrupts from different devices (for example, thermal, altitude, and velocity sensors). The ADM803/ADM809/ADM810 can easily be integrated into existing interrupt-handling circuits, as shown in Figure 12, or can be used as standalone devices.
