

4 x 45 W power amplifier with full I²C diagnostics, high efficiency and low voltage operation

Datasheet - production data

- Improved SVR suppression during battery transients
- Capable to operate down to 6 V (e.g. "Start-stop")

Description

The TDA75610LV is a new quad bridge car radio amplifier, designed in BCD technology, in order to include a wide range of innovative features in a very compact and flexible device.

The TDA75610LV is equipped with the most complete diagnostics array that communicates the status of each speaker through the I²C bus.

The dissipated output power under average listening condition is significantly reduced when compared to the conventional class AB solutions, thanks to the patented 'class SB' efficiency concept. TDA75610LV has been designed to be very robust against several kinds of misconnections. It is moreover compliant to the most recent OEM specifications for low voltage operation (so called 'start-stop' battery profile during engine stop), helping car manufacturers to reduce the overall emissions and thus contributing to environment protection. The ST BCD in combination with 'class SB' efficiency and 'intelligent power' has been sold in million of units to most known car manufacturers, the TDA75610LV is the last and most compact member of this power amplifiers family.

Features

- Multipower BCD technology
- MOSFET output power stage
- DMOS power output
- High efficiency (class SB)
- High output power capability 4x25 W/4 Ω @ 14.4 V, 1 kHz, 10% THD, 4 x 45 W max power
- 2 Ω driving capability (64 W max power)
- Full I²C bus driving:
 - Standby
 - Independent front/rear soft play/mute
 - Selectable gain 26 dB /16 dB (for low noise line output function)
 - High efficiency enable/disable
 - I²C bus digital diagnostics (including DC and AC load detection)
- Flexible fault detection through integrated diagnostic
- DC offset detection
- Four independent short circuit protection
- Clipping detector pin with selectable threshold (2 %/10 %)
- Standby/mute pin
- Linear thermal shutdown with multiple thermal warning
- ESD protection
- Very robust against misconnections

3 Electrical specifications

3.1 Absolute maximum ratings

Table 3. Absolute maximum ratings

Symbol	Parameter	Value	Unit
V_{op}	Operating supply voltage ⁽¹⁾	18	V
V_S	DC supply voltage	28	V
V_{peak}	Peak supply voltage (for $t_{max} = 50$ ms)	50	V
GNDmax	Ground pins voltage	-0.3 to 0.3	V
V_{CK}, V_{DATA}	CK and DATA pin voltage	-0.3 to 6	V
V_{cd}	Clip detector voltage	-0.3 to 5.5	V
V_{stby}	STBY pin voltage	-0.3 to V_{op}	V
I_O	Output peak current (not repetitive $t_{max} = 100$ ms)	8	A
	Output peak current (repetitive $f > 10$ kHz)	6	
P_{tot}	Power dissipation $T_{case} = 70^\circ\text{C}$	85	W
T_{stg}, T_j	Storage and junction temperature ⁽²⁾	-55 to 150	$^\circ\text{C}$
T_{amb}	Operative temperature range	-40 to 105	$^\circ\text{C}$

1. For $R_L = 2\ \Omega$ the output current limit might be reached for $V_{OP} > 16$ V; thus triggering sel-protection.

2. A suitable dissipation system should be used to keep T_j inside the specified limits.

3.2 Thermal data

Table 4. Thermal data

Symbol	Parameter	PowerSO	Flexiwatt	Unit
$R_{th\ j-case}$	Thermal resistance junction-to-caseMax.	1	1	$^\circ\text{C}/\text{W}$

3.3 Electrical characteristics

Refer to the test circuit, $V_S = 14.4\text{ V}$; $R_L = 4\ \Omega$; $f = 1\text{ kHz}$; $G_V = 26\text{ dB}$; $T_{\text{amb}} = 25\text{ }^\circ\text{C}$; unless otherwise specified.

Tested at $T_{\text{amb}} = 25\text{ }^\circ\text{C}$ and $T_{\text{hot}} = 105\text{ }^\circ\text{C}$; functionality guaranteed for $T_J = -40\text{ }^\circ\text{C}$ to $150\text{ }^\circ\text{C}$.

		Line driver mode	-	-	1.5	Ω

Table 5. Electrical characteristics (continued)

Symbol	Parameter	Test condition	Min.	Typ.	Max.	Unit
V _O	Offset detection	Power amplifier in play, AC input signals = 0	±1.5	±2	±2.5	V
I _{NLH}	Normal load current detection	V _O < (V _S -5)pk, IB2 (D7) = 0	500	-	-	mA
I _{OLH}	Open load current detection		-	-	250	mA
I _{NLL}	Normal load current detection	V _O < (V _S -5)pk, IB2 (D7) = 1	250	-	-	mA
I _{OLL}	Open load current detection		-	-	125	mA
I ² C bus interface						
S _{CL}	Clock frequency	-	-	-	400	kHz
V _{IL}	Input low voltage	-	-	-	1.5	V
V _{IH}	Input high voltage	-	2.3	-	-	V

1. When $V_S > 16\text{ V}$ the output current limit is reached (triggering embedded internal protections).
2. In legacy mode only low threshold option is available.
3. Saturated square wave output.
4. Voltage ramp on STBY pin:
from 3.3 V to 4.2 V in $t \geq 40\text{ ms}$.
In case of I²C mode command IB1(D1) = 1 (Mute → Unmute rear channels) and/or IB1(D2) = 1 (Mute → Unmute front channels) must be transmitted before to start the voltage ramp on STBY pin.
5. Voltage ramp on STBY pin:
from 4.05 V to 3.55 V in $t \geq 40\text{ ms}$.
In case of I²C mode command IB1(D1) = 0 (Unmute → Mute rear channels) and/or IB1(D2) = 0 (Unmute → Mute front channels) must be NOT transmitted before to start the voltage ramp on STBY pin.

4 Diagnostics functional description

4.1 Turn-on diagnostic

It is recommended to activate this function at the turn-on (standby out) through an I²C bus request. Detectable output faults are:

- SHORT TO GND
- SHORT TO VS
- SHORT ACROSS THE SPEAKER
- OPEN SPEAKER

To verify if any of the above misconnections are in place, a subsonic (inaudible) current pulse ([Figure 23](#)) is internally generated, sent through the speaker(s) and sunk back. The Turn On diagnostic status is internally stored until a successive diagnostic pulse is requested (after a I²C reading).

If the "standby out" and "diag. enable" commands are both given through a single programming step, the pulse takes place first (during the pulse the power stage stays 'off', showing high impedance at the outputs).

Afterwards, when the amplifier is biased, the PERMANENT diagnostic takes place. The previous turn-on state is kept until a short appears at the outputs.

Figure 23. Turn-on diagnostic: working principle

[Figure 24](#) and [25](#) show SVR and OUTPUT waveforms at the turn-on (standby out) with and without turn-on diagnostic.

Figure 24. SVR and output behavior (Case 1: without turn-on diagnostic)

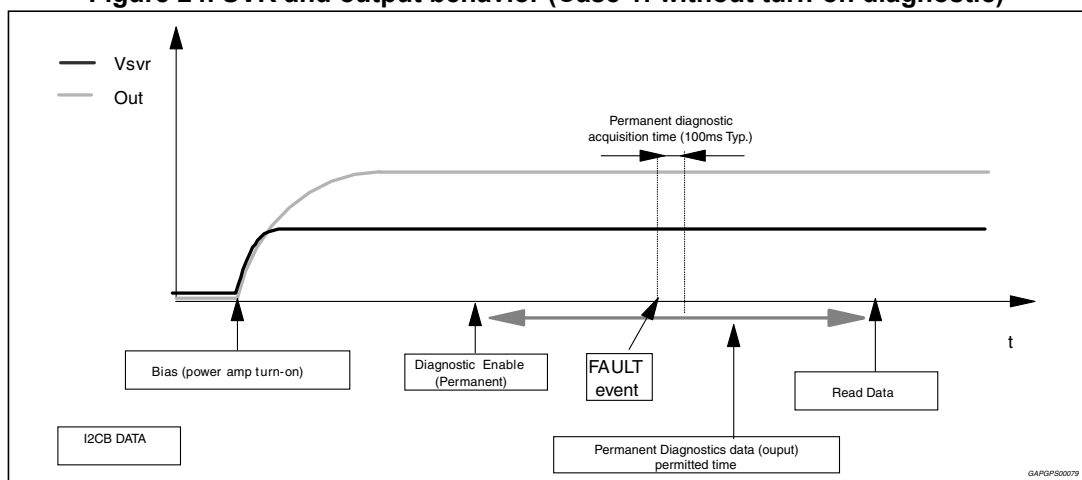

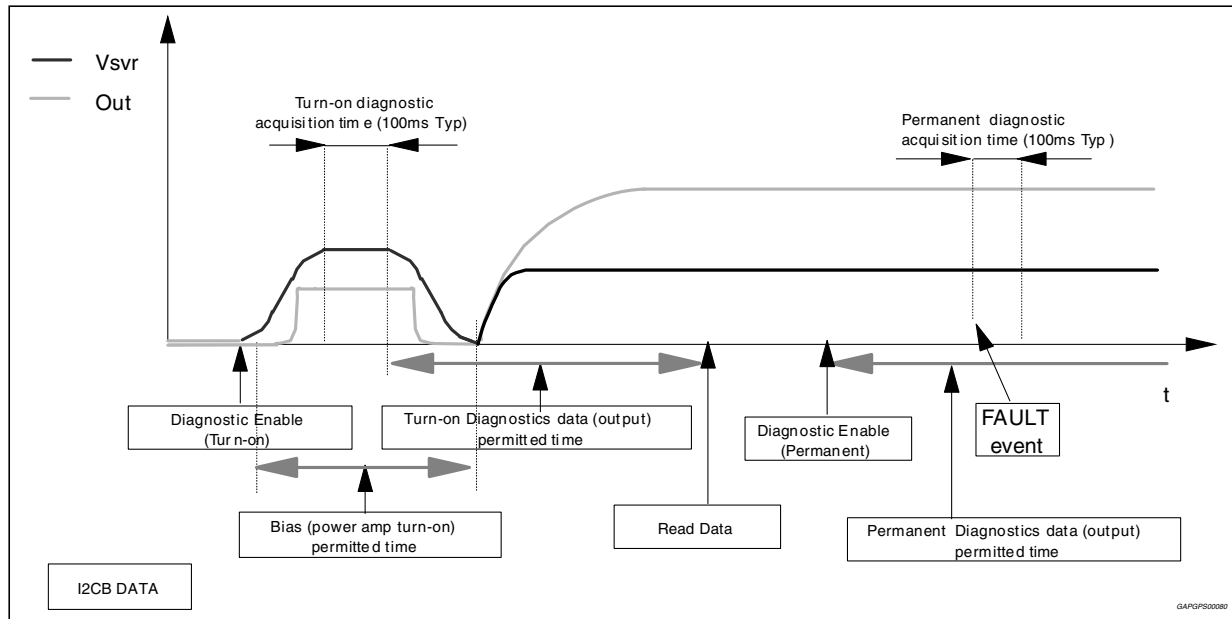

Figure 25. SVR and output pin behavior (Case 2: with turn-on diagnostic)

The information related to the outputs status is read and memorized at the end of the current pulse plateau. The acquisition time is 100 ms (typ.). No audible noise is generated in the process. As for SHORT TO GND / Vs the fault-detection thresholds remain unchanged from 26 dB to 16 dB gain setting. They are as follows:

Figure 26. Short circuit detection thresholds

Concerning SHORT ACROSS THE SPEAKER / OPEN SPEAKER, the threshold varies from 26 dB to 16 dB gain setting, since different loads are expected (either normal speaker's impedance or high impedance). The values in case of 26 dB gain are as follows:

Figure 27. Load detection thresholds - high gain setting

If the Line-Driver mode ($G_v = 16$ dB and Line Driver Mode diagnostic = 1) is selected, the same thresholds will change as follows:

Figure 28. Load detection threshold - low gain setting

4.2 Permanent diagnostics

Detectable conventional faults are:

- Short to GND
- Short to Vs
- Short across the speaker

The following additional feature is provided:

- Output offset detection

The TDA75610LV has 2 operating status:

1. **RESTART mode.** The diagnostic is not enabled. Each audio channel operates independently of each other. If any of the a.m. faults occurs, only the channel(s) interested is shut down. A check of the output status is made every 1 ms (*Figure 29*). Restart takes place when the overload is removed.
2. **DIAGNOSTIC mode.** It is enabled via I²C bus and it self activates if an output overload (such as to cause the intervention of the short-circuit protection) occurs to the speakers outputs. Once activated, the diagnostics procedure develops as follows (*Figure 30*):
 - To avoid momentary re-circulation spikes from giving erroneous diagnostics, a check of the output status is made after 1ms: if normal situation (no overloads) is detected, the diagnostic is not performed and the channel returns active.
 - Instead, if an overload is detected during the check after 1 ms, then a diagnostic cycle having a duration of about 100 ms is started.
 - After a diagnostic cycle, the audio channel interested by the fault is switched to RESTART mode. The relevant data are stored inside the device and can be read by the microprocessor. When one cycle has terminated, the next one is activated by an I²C reading. This is to ensure continuous diagnostics throughout the car-radio operating time.
 - To check the status of the device a sampling system is needed. The timing is chosen at microprocessor level (over half a second is recommended).

Figure 29. Restart timing without diagnostic enable (permanent) - Each 1 mS time, a sampling of the fault is done

Figure 30. Restart timing with diagnostic enable (permanent)

4.3 Output DC offset detection

Any DC output offset exceeding ± 2 V are signalled out. This inconvenient might occur as a consequence of initially defective or aged and worn-out input capacitors feeding a DC component to the inputs, so putting the speakers at risk of overheating.

This diagnostic has to be performed with low-level output AC signal (or $V_{in} = 0$).

The test is run with selectable time duration by microprocessor (from a "start" to a "stop" command):

- START = Last reading operation or setting IB1 - D5 - (OFFSET enable) to 1
- STOP = Actual reading operation

Excess offset is signalled out if it is persistent of all the assigned testing time. This feature is disabled if any overloads leading to activation of the short-circuit protection occurs in the process.

4.4 AC diagnostic

It is targeted at detecting accidental disconnection of tweeters in 2-way speaker and, more in general, presence of capacitive (AC) coupled loads.

This diagnostic is based on the notion that the overall speaker's impedance (woofer + parallel tweeter) will tend to increase towards high frequencies if the tweeter gets disconnected, because the remaining speaker (woofer) would be out of its operating range (high impedance). The diagnostic decision is made according to peak output current thresholds, and it is enabled by setting (IB2-D2) = 1. Two different detection levels are available:

- High current threshold IB2 (D7) = 0
 - $I_{out} > 500$ mApk = normal status
 - $I_{out} < 250$ mApk = open tweeter
- Low current threshold IB2 (D7) = 1
 - $I_{out} > 250$ mApk = normal status
 - $I_{out} < 125$ mApk = open tweeter

To correctly implement this feature, it is necessary to briefly provide a signal tone (with the amplifier in "play") whose frequency and magnitude are such as to determine an output current higher than 500 mApk with IB2(D7) = 0 (higher than 250 mApk with IB2(D7) = 1) in normal conditions and lower than 250 mApk with IB2(D7) = 0 (lower than 125 mApk with IB2(D7)=1) should the parallel tweeter be missing.

The test has to last for a minimum number of 3 sine cycles starting from the activation of the AC diagnostic function IB2<D2>) up to the I²C reading of the results (measuring period). To confirm presence of tweeter, it is necessary to find at least 3 current pulses over the above threshold over all the measuring period, else an "open tweeter" message will be issued.

The frequency / magnitude setting of the test tone depends on the impedance characteristics of each specific speaker being used, with or without the tweeter connected (to be calculated case by case). High-frequency tones (> 10 kHz) or even ultrasonic signals are recommended for their negligible acoustic impact and also to maximize the impedance module's ratio between with tweeter-on and tweeter-off.

Figure 31 and *32* shows the load impedance as a function of the peak output voltage and the relevant diagnostic fields.

It is recommended to keep output voltage always below 8 V (high threshold case) or 4 V (low threshold case) to avoid the circuit to saturate (causing wrong detection cases).

This feature is disabled if any overloads leading to activation of the short-circuit protection occurs in the process.

Figure 31. Current detection high: load impedance $|Z|$ vs. output peak voltage

Figure 32. Current detection low: load impedance $|Z|$ vs. output peak voltage

5 Multiple faults

When more misconnections are simultaneously in place at the audio outputs, it is guaranteed that at least one of them is initially read out. The others are notified after successive cycles of I²C reading and faults removal, provided that the diagnostic is enabled. This is true for both kinds of diagnostic (Turn on and Permanent).

The table below shows all the couples of double-fault possible. It should be taken into account that a short circuit with the 4 ohm speaker unconnected is considered as double fault.

Table 6. Double fault table for turn on diagnostic

	S. GND	S. Vs	S. Across L.	Open L.
S. GND	S. GND	S. Vs + S. GND	S. GND	S. GND
S. Vs	/	S. Vs	S. Vs	S. Vs
S. Across L.	/	/	S. Across L.	N.A.
Open L.	/	/	/	Open L. (*)

In Permanent Diagnostic the table is the same, with only a difference concerning Open Load(*), which is not among the recognizable faults. Should an Open Load be present during the device's normal working, it would be detected at a subsequent Turn on Diagnostic cycle (i.e. at the successive Car Radio Turn on).

5.1 Faults availability

All the results coming from I²C bus, by read operations, are the consequence of measurements inside a defined period of time. If the fault is stable throughout the whole period, it will be sent out.

To guarantee always resident functions, every kind of diagnostic cycles (Turn on, Permanent, Offset) will be reactivate after any I²C reading operation. So, when the micro reads the I²C, a new cycle will be able to start, but the read data will come from the previous diag. cycle (i.e. The device is in Turn On state, with a short to Gnd, then the short is removed and micro reads I²C. The short to Gnd is still present in bytes, because it is the result of the previous cycle. If another I²C reading operation occurs, the bytes do not show the short). In general to observe a change in Diagnostic bytes, two I²C reading operations are necessary.

6 Thermal protection

Thermal protection is implemented through thermal foldback (*Figure 33*).

Thermal foldback begins limiting the audio input to the amplifier stage as the junction temperatures rise above the normal operating range. This effectively limits the output power capability of the device thus reducing the temperature to acceptable levels without totally interrupting the operation of the device.

The output power will decrease to the point at which thermal equilibrium is reached. Thermal equilibrium will be reached when the reduction in output power reduces the dissipated power such that the die temperature falls below the thermal foldback threshold. Should the device cool, the audio level will increase until a new thermal equilibrium is reached or the amplifier reaches full power. Thermal foldback will reduce the audio output level in a linear manner.

Three thermal warning are available through the I²C bus data. After thermal shut down threshold is reached, the CD could toggle (as shown in *Figure 33*) or stay low, depending on signal level.

Figure 33. Thermal foldback diagram

6.1 Fast muting

The muting time can be shortened to less than 1.5 ms by setting (IB2) D5 = 1. This option can be useful in transient battery situations (i.e. during car engine cranking) to quickly turnoff the amplifier to avoid any audible effects caused by noise/transients being injected by preamp stages. The bit must be set back to "0" shortly after the mute transition.

7 Battery transitions management

7.1 Low voltage operation (“start stop”)

The most recent OEM specifications are requiring automatic stop of car engine at traffic light, in order to reduce emissions of polluting substances. The TDA75610LV, thanks to its innovating design, allows to go on playing sound when battery falls down to 6/7V during such conditions, without producing pop noise. The maximum system power will be reduced accordingly.

Supported battery cranking curves are shown below, indicating the shape and durations of allowed battery transitions.

Figure 34. Worst case battery cranking curve sample 1

$V1 = 12\text{ V}$; $V2 = 6\text{ V}$; $V3 = 7\text{ V}$; $V4 = 8\text{ V}$

$t1 = 2\text{ ms}$; $t2 = 50\text{ ms}$; $t3 = 5\text{ ms}$; $t4 = 300\text{ ms}$; $t5 = 10\text{ ms}$; $t6 = 1\text{ s}$; $t7 = 2\text{ ms}$

Figure 35. Worst case battery cranking curve sample 2

$V1 = 12\text{ V}$; $V2 = 6\text{ V}$; $V3 = 7\text{ V}$

$t1 = 2\text{ ms}$; $t2 = 5\text{ ms}$; $t3 = 15\text{ ms}$; $t5 = 1\text{ s}$; $t6 = 50\text{ ms}$

7.2 Advanced battery management

In addition to compatibility with low V_{batt} , the TDA75610LV is able to sustain upwards fast battery transitions (like the one showed in [Figure 36](#)) without causing unwanted audible effect, thanks to the innovative circuit topology.

Figure 36. Upwards fast battery transitions diagram

8 Application suggestion

8.1 Inputs impedance matching

Figure 37. Inputs impedance matching circuit

The above is a simplified input stage where it is visible that the AC-GND impedance ($60\text{ k}\Omega$) is the same as the input one.

During battery variations the SVR voltage is moved and V_{IN} and V_{AC-GND} tracks it through the two R-C networks.

Any differences of this two time constants can produce a differential input voltage, which can produce a noise.

Consequently, any additional passive components at the inputs (other than the input capacitors) such as series resistance or R dividers must be compensated for at AC-GND level by connecting the same equivalent resistance in series to C_{AC-GND} .

A good 1:1 matching ($Z_{AC-GND} = Z_{IN}$) is therefore recommended to minimize pop. This rule applies to both "4-CH operation" and "2-CH operation", as any unused input has to be AC-grounded (through the same C_{IN} value).

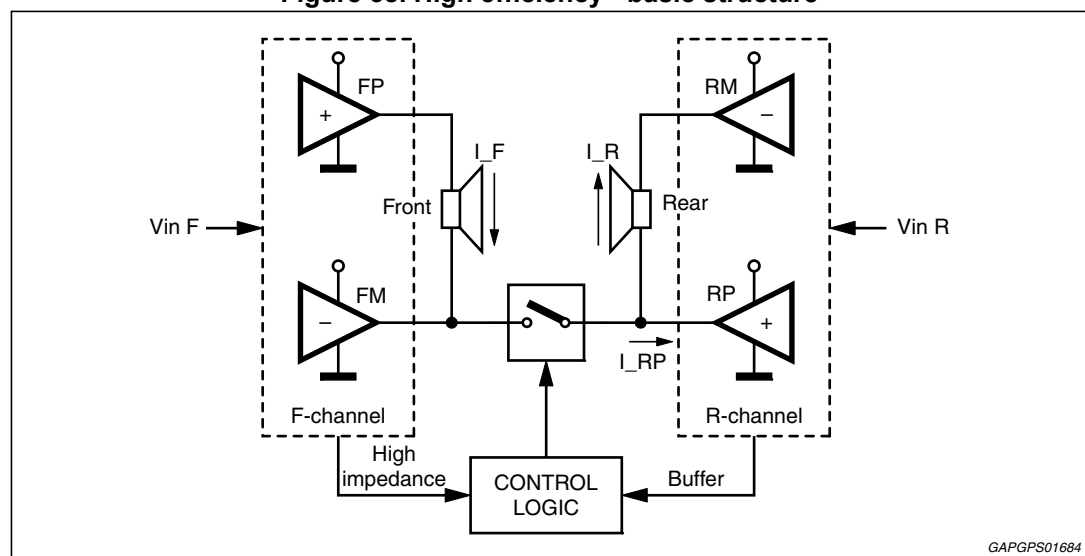

8.2 High efficiency introduction

Thanks to its operating principle, the TDA75610LV obtains a substantial reduction of power dissipation from traditional class-AB amplifiers without being affected by the massive radiation effects and complex circuitry normally associated with class-D solutions.

The high efficiency operating principle is based on the use of bridge structures which are connected by means of a power switch. In particular, as shown in [Figure 1](#), Ch1 is linked to Ch2, while Ch3 to Ch4. The switch, controlled by a logic circuit which senses the input signals, is closed at low volumes (output power steadily lower than 2.5 W) and the system acts like a "single bridge" with double load. In this case, the total power dissipation is a quarter of a double bridge.

Due to its structure, the highest efficiency level can be reached when symmetrical loads are applied on channels sharing the same switch.

Figure 38. High efficiency - basic structure

When the power demand increases to more than 2.5 W, the system behavior is switched back to a standard double bridge in order to guarantee the maximum output power, while in the 6 V start-stop devices the High Efficiency mode is automatically disabled at low V_{CC} ($7.3 \text{ V} \pm 0.3 \text{ V}$). No need to re-program it when V_{CC} goes back to normal levels.

In the range 2-4 W (@ $V_{CC} = 14.4 \text{ V}$, $R_L = 4 \Omega$), with the High Efficiency mode, the dissipated power gets up to 50 % less than the value obtained with the standard mode.

9 I²C bus

9.1 I²C programming/reading sequences

A correct turn on/off sequence with respect to the diagnostic timings and producing no audible noises could be as follows (after battery connection):

- TURN-ON: PIN2 > 4.5 V --- 10 ms --- (STAND-BY OUT + DIAG ENABLE) --- 1 s (min) --- MUTING OUT
- TURN-OFF: MUTING IN - wait for 50 ms - HW ST-BY IN (ST-BY pin ≤ 1.2 V)
- Car Radio Installation: PIN2 > 4.5 V --- 10 ms DIAG ENABLE (write) --- 200 ms --- I²C read (repeat until All faults disappear).
- OFFSET TEST: Device in Play (no signal) -- OFFSET ENABLE - 30 ms - I²C reading (repeat I²C reading until high-offset message disappears).

9.2 Address selection and I²C disable

When the ADSEL/I2CDIS pin is left open the I²C bus is disabled and the device can be controlled by the STBY/MUTE pin.

In this status (no - I²C bus) the CK pin enables the HIGH-EFFICIENCY MODE (0 = STD MODE; 1 = HE MODE) and the DATA pin sets the gain (0 = 26 dB; 1 = 16 dB).

When the ADSEL/I2CDIS pin is connected to GND the I²C bus is active with address <1101100-x>.

To select the other I²C address a resistor must be connected to ADSEL/I2CDIS pin as following:

0 < R < 1 kΩ: I²C bus active with address <1101100x>

11 kΩ < R < 21 kΩ: I²C bus active with address <1101101x>

40 kΩ < R < 70 kΩ: I²C bus active with address <1101110x>

R > 120 kΩ Legacy mode

(x: read/write bit sector)

9.3 I²C bus interface

Data transmission from microprocessor to the TDA75610LV and viceversa takes place through the 2 wires I²C bus interface, consisting of the two lines SDA and SCL (pull-up resistors to positive supply voltage must be connected).

9.3.1 Data validity

As shown by [Figure 39](#), the data on the SDA line must be stable during the high period of the clock. The HIGH and LOW state of the data line can only change when the clock signal on the SCL line is LOW.

9.3.2 Start and stop conditions

As shown by [Figure 40](#) a start condition is a HIGH to LOW transition of the SDA line while SCL is HIGH. The stop condition is a LOW to HIGH transition of the SDA line while SCL is HIGH.

9.3.3 Byte format

Every byte transferred to the SDA line must contain 8 bits. Each byte must be followed by an acknowledge bit. The MSB is transferred first.

9.3.4 Acknowledge

The transmitter* puts a resistive HIGH level on the SDA line during the acknowledge clock pulse (see [Figure 41](#)). The receiver** has to pull-down (LOW) the SDA line during the acknowledge clock pulse, so that the SDA line is stable LOW during this clock pulse.

* Transmitter

- master (μP) when it writes an address to the TDA75610LV
- slave (TDA75610LV) when the μP reads a data byte from TDA75610LV

** Receiver

- slave (TDA75610LV) when the μP writes an address to the TDA75610LV
- master (μP) when it reads a data byte from TDA75610LV

Figure 39. Data validity on the I²C bus

Figure 40. Timing diagram on the I²C bus

Figure 41. Acknowledge on the I²C bus

10 Software specifications

All the functions of the TDA75610LV are activated by I²C interface.

The bit 0 of the "ADDRESS BYTE" defines if the next bytes are write instruction (from μ P to TDA75610LV) or read instruction (from TDA75610LV to μ P).

Chip address

D7						D0		
1	1	0	1	1	(*)	(*)	X	D8 Hex

X = 0 Write to device

X = 1 Read from device

If R/W = 0, the μ P sends 2 "Instruction Bytes": IB1 and IB2.

(*) address selector bit, please refer to address selection description on [Chapter 9.2](#).

Table 7. IB1

Bit	Instruction decoding bit
D7	Supply transition mute threshold high (D7 = 1) Supply transition mute threshold low (D7 = 0)
D6	Diagnostic enable (D6 = 1) Diagnostic defeat (D6 = 0)
D5	Offset Detection enable (D5 = 1) Offset Detection defeat (D5 = 0)
D4	Front Channel (CH1, CH3) Gain = 26 dB (D4 = 0) Gain = 16 dB (D4 = 1)
D3	Rear Channel (CH2, CH4) Gain = 26 dB (D3 = 0) Gain = 16 dB (D3 = 1)
D2	Mute front channels (D2 = 0) Unmute front channels (D2 = 1)
D1	Mute rear channels (D1 = 0) Unmute rear channels (D1 = 1)
D0	CD 2% (D0 = 0) CD 10% (D0 = 1)

11 Examples of bytes sequence

1 - Turn-On diagnostic - Write operation

Start	Address byte with D0 = 0	ACK	IB1 with D6 = 1	ACK	IB2	ACK	STOP
-------	--------------------------	-----	-----------------	-----	-----	-----	------

2 - Turn-On diagnostic - Read operation

Start	Address byte with D0 = 1	ACK	DB1	ACK	DB2	ACK	DB3	ACK	DB4	ACK	STOP
-------	--------------------------	-----	-----	-----	-----	-----	-----	-----	-----	-----	------

The delay from 1 to 2 can be selected by software, starting from 1ms

3a - Turn-On of the power amplifier with 26dB gain, mute on, diagnostic defeat, CD = 2%

Start	Address byte with D0 = 0	ACK	IB1	ACK	IB2	ACK	STOP
			X0000000		XXX1XX11		

3b - Turn-Off of the power amplifier

Start	Address byte with D0 = 0	ACK	IB1	ACK	IB2	ACK	STOP
			X0XXXXXX		XXX0XXXX		

4 - Offset detection procedure enable

Start	Address byte with D0 = 0	ACK	IB1	ACK	IB2	ACK	STOP
			XX1XX11X		XXX1XXXX		

5 - Offset detection procedure stop and reading operation (the results are valid only for the offset detection bits (D2 of the bytes DB1, DB2, DB3, DB4))

Start	Address byte with D0 = 1	ACK	DB1	ACK	DB2	ACK	DB3	ACK	DB4	ACK	STOP
-------	--------------------------	-----	-----	-----	-----	-----	-----	-----	-----	-----	------

- The purpose of this test is to check if a D.C. offset (2V typ.) is present on the outputs, produced by input capacitor with anomalous leakage current or humidity between pins.
- The delay from 4 to 5 can be selected by software, starting from 1ms

12 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: www.st.com.

ECOPACK® is an ST trademark.

V2	3°	5°	7°	3°	5°	7°
V3	12°	15°	18°	12°	15°	18°
V4		5°			5°	
V5		20°			20°	

(*) Golden parameters.

(**) – Dimension "F" doesn't include dam-bar protrusion.

– Dimensions "H" and "L" include mold flash or protrusions.

13 Revision history

Table 13. Document revision history

Date	Revision	Changes
18-Jan-2013	1	Initial release.
25-Jan-2013	2	Updated <i>Chapter 8.2: High efficiency introduction on page 28</i> .
18-Sep-2013	3	Updated Disclaimer.
10-Feb-2014	4	Updated <i>Table 5: Electrical characteristics</i> and <i>Section 9.1: I²C programming/reading sequences</i> .
10-Mar-2014	5	Updated <i>Figure 2, Figure 3</i> and <i>Table 5: Electrical characteristics</i> (ΔV_{OITU} parameter on page 12).
28-Apr-2014	6	Updated <i>Section 9.2: Address selection and I²C disable on page 29</i> .
18-Sep-2014	7	Updated <i>Section 9.1: I²C programming/reading sequences on page 29</i> .
