

Ordering Information

Part Numbers	Description	Module Speed
SG564288FG8N6DB	128Mx64 (1GB), DDR2, 240-pin DIMM, Unbuffered, Non-ECC, 128Mx8 Based, DDR2-400-333, 30.00mm, 22Ω DQ termination, Green Module (RoHS Compliant).	PC2-3200 @ CL 3.0
SG564288FG8N6DG	128Mx64 (1GB), DDR2, 240-pin DIMM, Unbuffered, Non-ECC, 128Mx8 Based, DDR2-533-444, 30.00mm, 22Ω DQ termination, Green Module (RoHS Compliant).	PC2-4200 @ CL 4.0
SG564288FG8N6IL	128Mx64 (1GB), DDR2, 240-pin DIMM, Unbuffered, Non-ECC, 128Mx8 Based, DDR2-667-555, 30.00mm, 22Ω DQ termination, Green Module (RoHS Compliant).	PC2-5300 @ CL 5.0
SG564288FG8N6IR	128Mx64 (1GB), DDR2, 240-pin DIMM, Unbuffered, Non-ECC, 128Mx8 Based, DDR2-800-555, 30.00mm, 22Ω DQ termination, Green Module (RoHS Compliant).	PC2-6400 @ CL 5.0
SG564288FG8N6KF	128Mx64 (1GB), DDR2, 240-pin DIMM, Unbuffered, Non-ECC, 128Mx8 Based, DDR2-800-666, 30.00mm, 22Ω DQ termination, Green Module (RoHS Compliant).	PC2-6400 @ CL 6.0

(All specifications of this module are subject to change without notice.)

Revision History

- **March 24, 2008**
Datasheet released.

**1GByte (128Mx64) DDR2 SDRAM Module - 128Mx8 Based
240-pin DIMM, Unbuffered, Non-ECC**

Features

- Standard : JEDEC
- Configuration : Non-ECC
- Cycle Time : 5.0ns (DDR2-400)
3.75ns (DDR2-533)
3.0ns (DDR2-667)
2.5 (DDR2-800)
- CAS# Latency : 3.0, 4.0 (-DB/-DG)
4.0, 5.0 (-IL/-IR)
5.0, 6.0 (-KF)
- Posted CAS#/Additive Latency (AL) : 0, 1.0, 2.0, 3.0 & 4.0
- Write Latency (WL) : Read (CAS#) Latency - 1
- Burst Length : 4, 8
- Burst Type : Sequential/Interleave
- Module Ranks : 1 Rank of x8 devices
- No. of Devices : 8
- No. of Internal Banks per SDRAM : 8
- Operating Voltage : 1.8V
- Refresh : 8K/64ms
- Device Physicals : FBGA
- Lead Finish : Gold
- Length x Height : 133.35mm x 30.00mm
- No. of sides : Single-sided
- Mating Connector (Examples) Vertical : Molex - 87705-0021

DDR2 240-Pin DIMM Pin List

Pin Description Table

Symbol	Type	Polarity	Function
CK0~CK2	SSTL_18	Positive Edge	Positive line of the differential pair of system clock inputs. (All DDR2 SDRAM address and control inputs are sampled on the rising edge of their associated clocks. Output data is referenced at the crossings of the clocks.)
CK0#~CK2#	SSTL_18	Negative Edge	Negative line of the differential pair of system clock inputs.
ODT0	SSTL_18	Active High	On-Die Termination: ODT when high enables termination resistance internal to the DDR2 SDRAM. When enabled, ODT is only applied to each of the following pins: DQ, DQS, and DM. The ODT input will be ignored if disabled in Extended Mode Register (EMRS).
CKE0	SSTL_18	Active High	Activates the DDR2 SDRAM CLK signal when high and deactivates the CLK signal when low. By deactivating the clocks, CKE low initiates the Power Down mode, or the Self Refresh mode.
CS0#	SSTL_18	Active Low	Enables the associated DDR2 SDRAM command decoder when low and disables decoder when high. When decoder is disabled, new commands are ignored but previous operations continue.
RAS#, CAS#, WE#	SSTL_18	Active Low	When sampled at the positive rising edge of the clock, CAS#, RAS#, and WE# define the operations to be executed by the SDRAM.
BA0~BA2	SSTL_18	-	Bank Address define to which bank an Activate, Read, Write or Precharge command is being applied. Bank address also determines if the Mode Register or Extended Mode Register is to be accessed during a MRS or EMRS cycle.

Pin Description Table (Contd.)

Symbol	Type	Polarity	Function
A0~A9, A10/AP, A11~A13	SSTL_18	-	During a Bank Activate command cycle, A0-A13 defines the row address (RA0-RA13) when sampled at the rising clock edge. During a Read or Write command cycle, A0-A9 defines the column address (CA0-CA9) when sampled at the rising clock edge. In addition to the column address, A10/AP is used to invoke autoprecharge operation at the end of the burst read or write cycle. If AP is high, autoprecharge is selected and BA0~BA2 defines the bank to be precharged. If AP is low, autoprecharge is disabled. During a Precharge command cycle, A10/AP is used in conjunction with BA0~BA2 to control which bank(s) to precharge. If AP is high, all banks will be precharged regardless of the state of BA0~BA2. If AP is low, BA0~BA2 are used to define which bank to precharge. The address inputs also provide the op-code during Mode Register Set commands.
DQ0~DQ63	SSTL_18	-	Data and Check Bit Input/Output pins.
DQS0~DQS7	SSTL_18	Positive Edge	SDRAM differential data strobe for input and output data.
DQS0#~DQS7#	SSTL_18	Negative Edge	SDRAM differential data strobe for input and output data.
DM0~DM7	SSTL_18	Active High	DM is an input mask signal for write data. Input data is masked when DM is sampled high coincident with that input data during a write access. DM is sampled on both edges of DQS. Although DM pins are input only, the DM loading matches the DQ/DQS loading.
SA0~SA2	LVTTTL	-	Slave Address Select for EEPROM. These pins are used to configure the presence-detect device.
SDA	LVTTTL	-	Serial Bus Data Line for EEPROM. SDA is a bidirectional pin used to transfer addresses and data into and out of the presence-detect portion of the module. A resistor must be connected from the SDA bus line to V _{DDSPD} to act as pull up on the system board.
SCL	LVTTTL	-	Serial Bus Clock for EEPROM. SCL is used to synchronize the presence-detect data transfer to and from the module. A resistor may be connected from the SCL bus line to V _{DDSPD} to act as pull up on the system board.
V _{DD}	Supply	-	SDRAM positive power supply. 1.8V±0.1V
V _{SS}	Supply	-	Power supply return (ground).
V _{REF}	Supply	-	SDRAM I/O reference supply.
V _{DDQ}	Supply	-	SDRAM I/O Driver positive power supply. 1.8V±0.1V
V _{DDSPD}	Supply	-	Serial EEPROM positive power supply (wired to a separate power pin at the connector which supports operation from 1.7V to 3.6V).
NC	-	-	No Connect
DU	-	-	Do not use

Block Diagram

Note: Unless otherwise noted, data resistor values are $22\Omega \pm 5\%$.

Clock Wiring	
CK0/CK0#	2 SDRAMs
CK1/CK1#	3 SDRAMs
CK2/CK2#	3 SDRAMs

Notes:

1. Ax, BAx, RAS#, CAS#, WE# resistors: 10Ω±5%.
2. Data bits may be swapped within a device. However, DQ/DQS/DM relationship is maintained as shown.

Physical Dimensions

240-pin DIMM Module

(All dimensions are in millimeters with ± 0.15 mm tolerance unless specified otherwise.)

Serial Presence Detect Table (SG564288FG8N6DB/DG/IL/IR/KF)

Byte No.	Byte Description	Speed	Value Supported	Hex Value

Note:

- X represents the maximum CAS Latency.
 For DDR2-400-333, X = CL 4.0
 For DDR2-533-444, X = CL 4.0
 For DDR2-667-555, X = CL 5.0
 For DDR2-800-555, X = CL 5.0
 For DDR2-800-666, X = CL 6.0
- Manufacturing Location:
 00h - Undefined,
 01h - Fremont, USA,
 02h - Aguada, Puerto Rico,
 03h - East Kilbride, Scotland,
 04h - Penang, Malaysia,
 05h - Bangalore, India,
 06h - Sao Paulo, Brazil,
 07h - Aguadilla, Puerto Rico,
 08h - Mayaguez, Puerto Rico,
 09h - Santo Domingo, Dominican Republic,
 0Ah - Dongguan, China,

Mode Register Table Definition

The mode register stores the data for controlling the various operating modes of DDR2 SDRAM. It controls CAS latency, burst length, burst sequence, test mode, DLL reset, t_{WR} and various vendor specific options to make DDR2 SDRAM useful for various applications. The default value of the mode register is not defined, therefore the mode register must be written after power-up for proper operation. The mode register is written by asserting low on CS#, RAS#, CAS#, WE#, BA0 and BA1, while controlling the state of address pins A0~A15. The DDR2 SDRAM should be in all bank precharge with CKE already high prior to writing into the mode register. The mode register set command cycle time (t_{MRD}) is required to complete the write operation to the mode register. The mode register contents can be changed using the same command and clock cycle requirements during normal operation as long as all banks are in the precharge state. The mode register is divided into various fields depending on functionality. Burst length is defined by A0~A2 with options of 4 and 8 bit burst lengths. The burst length decodes are compatible with DDR SDRAM. Burst address sequence type is defined by A3, CAS latency is defined by A4~A6. The DDR2 doesn't support half clock latency mode. A7 is used for test mode. A8 is used for DLL reset. A7 must be set to low for normal MRS operation. Write recovery time t_{WR} is defined by A9~A11.

Notes:

- A14~A15 are reserved for future use and must be programmed to 0 when setting the mode register.
- WR min is determined by t_{CK} max and WR max is determined by t_{CK} min. WR in clock cycles is calculated by dividing t_{WR} (in ns) by t_{CK} (in ns) and rounding up to the next integer. The mode register must be programmed to this value.

Extended Mode Register Table Definition

The extended mode register controls functions beyond those controlled by the mode register; these additional functions are DLL enable/disable, output drive strength, ODT (R_{TT}), Posted CAS additive latency (AL), off-chip driver impedance calibration (OCD), DQS# enable/disable, RDQS/RDQS# enable/disable, and OUTPUT enable/disable. The extended mode register is programmed via the LOAD MODE (LM) command and will retain the stored information until it is programmed again or the device loses power. Reprogramming the extended mode register will not alter the contents of the memory array, provided it is performed correctly.

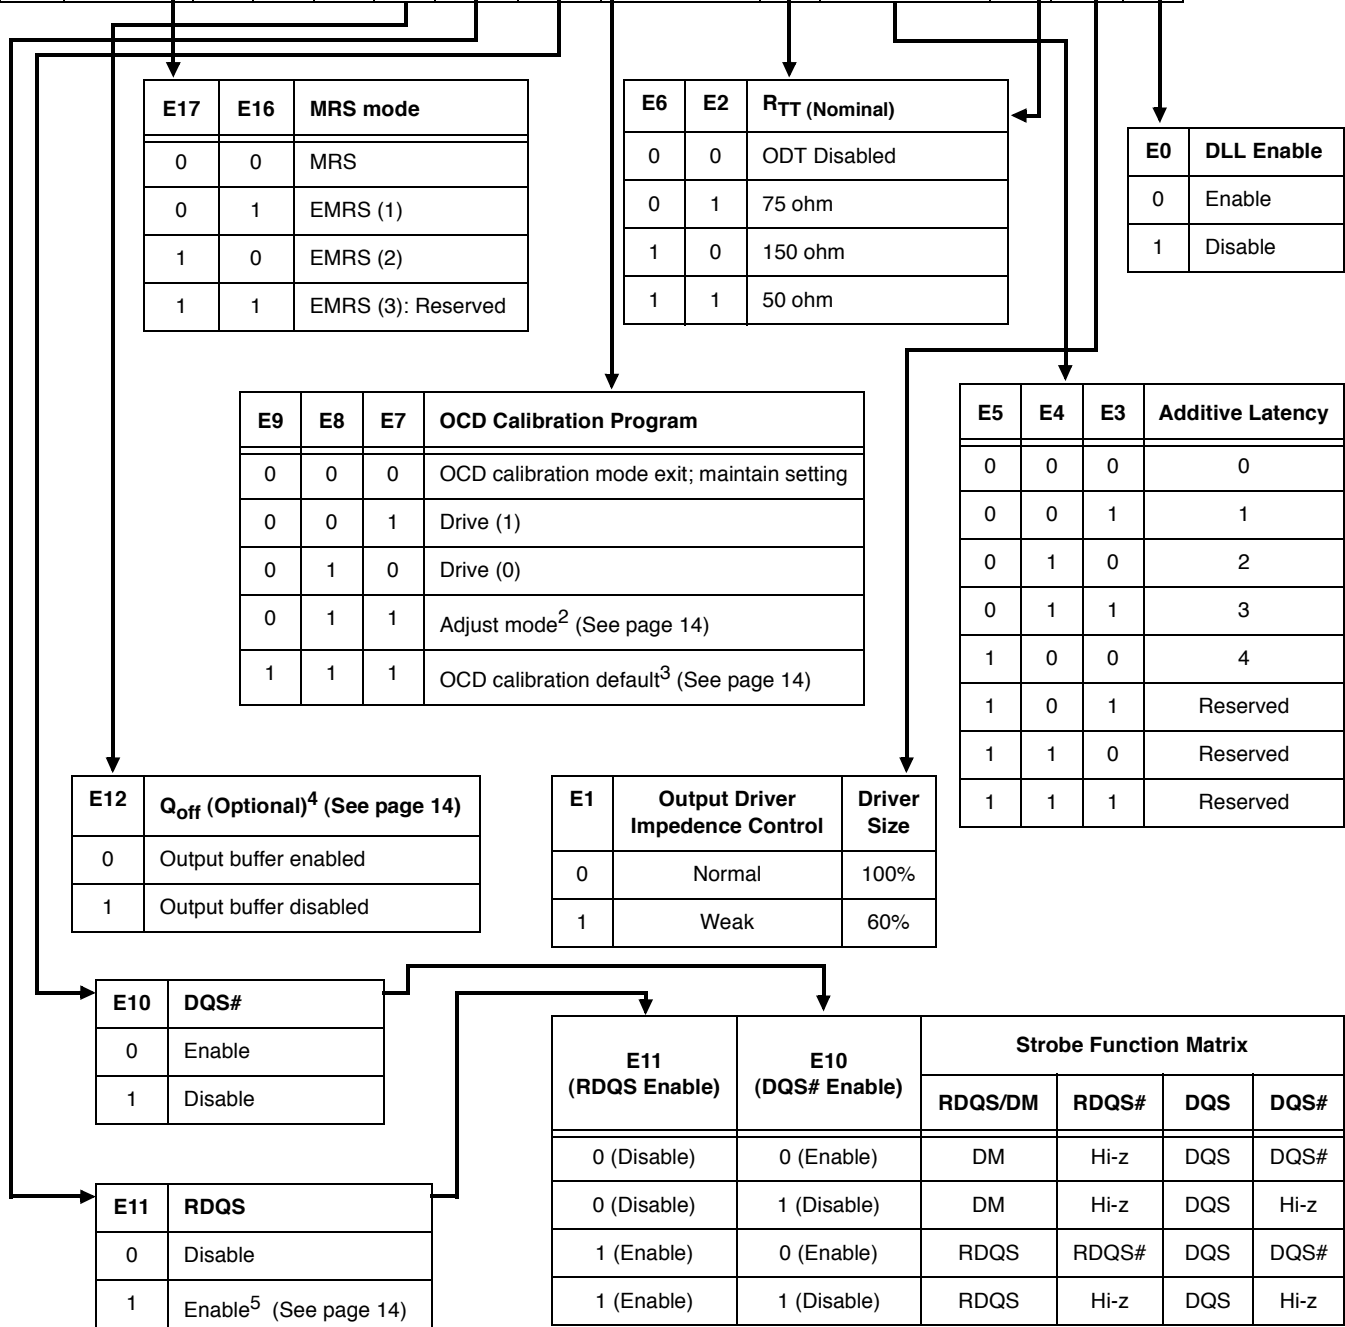

The extended mode register must be loaded when all banks are idle and no bursts are in progress, and the controller must wait the specified time t_{MRD} before initiating any subsequent operation. Violating either of these requirements could result in unspecified operation.

Notes:

1. A14~A15 are reserved for future use and must be programmed to 0 when setting the mode register.
2. When the adjust mode of the OCD Calibration Program is issued, AL from previously set value must be applied.
3. After setting the OCD Calibration Program to default, OCD mode needs to be exited by setting A9-A7 to 000.
4. Outputs disabled - DQs, DQSs, DQS#s, RDQSs, RDQS#s. This feature is used in conjunction with DIMM I_{DD} measurements when I_{DDQ} is not desired to be included.
5. If RDQS is enabled, the DM function is disabled. RDQS is active for reads and don't care for writes.

Extended Mode Register Table

No Operation	H	X	L	H	H	H	X	X	X	X	1
Device Deselect	H	X	H	X	X	X	X	X	X	X	1
Power Down Entry	H	L	H	X	X	X	X	X	X	X	1, 4
			L	H	H	H					
Power Down Exit	L	H	H	X	X	X	X	X	X	X	1, 4
			L	H	H	H					

Notes:

- All DDR2 SDRAM commands are defined by states of CS#, RAS#, CAS#, WE# and CKE at the rising edge of the clock.
- Bank addresses BA0, BA1, BA2 (BA) determine which bank is to be operated upon. For (E)MRS BA selects an (Extended) Mode Register.
- Burst reads or writes at BL = 4 cannot be terminated or interrupted.
- The Power Down Mode does not perform any refresh operations. The duration of power down is therefore limited by the refresh requirements.
- The state of ODT does not affect the states described in this table. The ODT function is not available during Self Refresh.
- "X" means "H or L (but a defined logic level)".
- Self Refresh Exit is asynchronous.
- An = A12 for 256Mb, A13 for 512Mb & 1 Gb, A14 for 2Gb.
- BAn = BA1 for up to 512Mb, BA2 for 1 Gb & 2Gb.

DC Characteristics

Absolute Maximum Ratings

Parameter	Symbol	Ratings	Unit	Notes
Voltage on V_{DD} relative to V_{SS}	V_{DD}	-1.0 ~ 2.3	V	
Voltage on V_{DDQ} relative to V_{SS}	V_{DDQ}	-0.5 ~ 2.3	V	
Voltage on any pin relative to V_{SS}	V_{IN}, V_{OUT}	-0.5 ~ 2.3	V	
Voltage on V_{DDSPD} relative to V_{SS}	V_{DDSPD}	1.7 ~ 3.6	V	
Operating Temperature (Ambient)	T_{OPR}	0 to +65	°C	
Operating Temperature (Case)	T_{CASE}	0 to +85	°C	1, 2
Storage Temperature	T_{STG}	-55 to +100	°C	

Notes:

- It is possible to operate the DRAM, Register & PLL up to 95°C.
- Above 85°C DRAM Case Temperature the Auto-Refresh command interval has to be reduced to $t_{REFI} = 3.9\mu s$.

Recommended DC Operating Conditions

($T_A = 0$ to +65°C)

Parameter	Symbol	Min	Typ	Max	Unit	Notes
Supply Voltage	V_{DD}	1.7	1.8	1.9	V	
I/O Supply Voltage	V_{DDQ}	1.7	1.8	1.9	V	
I/O Reference Voltage	V_{REF}	$0.49 \cdot V_{DDQ}$	$0.50 \cdot V_{DDQ}$	$0.51 \cdot V_{DDQ}$	mV	1, 2
I/O Termination Voltage	V_{TT}	$V_{REF} - 0.04$	V_{REF}	$V_{REF} + 0.04$	V	3
SPD Voltage	V_{DDSPD}	1.7	-	3.6	V	
Input High Voltage	$V_{IH(DC)}$	$V_{REF} + 0.125$	-	$V_{DDQ} + 0.3$	V	
Input Low Voltage	$V_{IL(DC)}$	-0.3	-	$V_{REF} - 0.125$	V	
Input Voltage Level, CK/CK#	$V_{IN(DC)}$	-0.3	-	$V_{DDQ} + 0.3$	V	
Input Differential Voltage, CK/CK#	$V_{ID(DC)}$	0.25	-	$V_{DDQ} + 0.6$	V	
Ground	V_{SS}	0	0	0	V	

Notes:

- V_{REF} is expected to track variation in V_{DDQ} .
- Peak to peak noise (non-common mode) on V_{REF} may not exceed $\pm 1\%$ of the DC value. Peak to peak AC noise on V_{REF} may not exceed $\pm 2\%$ of V_{REF} (DC). This measurement is to be taken at the nearest V_{REF} bypass capacitor.
- V_{TT} is not used on the module. It is the voltage used on the system board to terminate all the signals. However, this supply should track the variations in DC level of V_{REF} .

Capacitance
($V_{DD} = 1.8V \pm 0.1V$, $T_{Case} = +25^{\circ}C$)

Parameter	Symbol	Min	Max	Unit
Input Capacitance (CKn, CKn#)	C_{CK}	2.0	3.0	pF
Input Capacitance delta (CKn, CKn#)	C_{DCK}	-	-	pF
Input Capacitance (all other input-only pins)	C_I	2.5	3.5	pF
Input Capacitance delta (all other input-only pins)	C_{DI}	-	-	pF
Input/Output Capacitance (DQ, DQS, DQS#, CB)	C_{IO1}	2.5	4.0	pF
Input/Output Capacitance (DQ, DQS, DQS#, CB)	C_{IO2}	2.5	3.5	pF
Input/Output Capacitance delta (DQ, DQS, DQS#, CB)	C_{DIO}	-	0.5	pF

Notes:

1. C_{IO1} is for DDR2-400 and DDR2-533.
2. C_{IO2} is for DDR2-667 and DDR2-800.

AC Operating Conditions
($V_{DD} = 1.8V \pm 0.1V$, $V_{SS} = 0V$)

Parameter	Symbol	Min	Max	Unit	Notes
Input High Logic Voltage	$V_{IH(AC)}$	$V_{REF} + 0.250$	-	V	1, 2
Input Low Logic Voltage	$V_{IL(AC)}$	-	$V_{REF} - 0.250$	V	1, 2
Input differential voltage, CK and CK# inputs	$V_{ID(AC)}$	0.5	$V_{DDQ} + 0.6$	V	1, 2, 3
Input crossing point voltage, CK and CK# inputs	$V_{IX(AC)}$	$0.5 * V_{DDQ} - 0.175$	$0.5 * V_{DDQ} + 0.175$	V	1, 2, 3
AC differential crossing point voltage	$V_{OX(AC)}$	$0.5 * V_{DDQ} - 0.125$	$0.5 * V_{DDQ} + 0.125$	V	3

Notes:

1. Input slew rate is 1V/ns.
2. Inputs are not recognized as valid until V_{REF} stabilizes.
3. V_{ID} is the magnitude of the difference between the input level on CK and the input level on CK#.
4. The value of V_{IX}/V_{OX} is expected to equal $0.5 * V_{DDQ}$ of the transmitting device and must track variations in the DC level of the same.

ODT DC Electrical Characteristics

Parameter	Symbol	Min	Nom	Max	Unit	Notes
R _{TT} effective impedance value for 75Ω setting EMR (A6, A2) = 0, 1	R _{TT1} (EFF)	60	75	90	Ω	1
R _{TT} effective impedance value for 150Ω setting EMR (A6, A2) = 1, 0	R _{TT2} (EFF)	120	150	180	Ω	1
R _{TT} effective impedance value for 50Ω setting EMR (A6, A2) = 1, 1	R _{TT3} (EFF)	40	50	60	Ω	1
Deviation of VM with respect to V _{DDQ} /2	ΔVM	-6		+6	%	2

Notes:

1. R_{TT1}(EFF) and R_{TT2}(EFF) are determined by applying V_{IH(AC)} and V_{IL(AC)} to pin under test separately, then

$$\text{measure current } I(V_{IH(AC)}) \text{ and } I(V_{IL(AC)}) \text{ respectively. } R_{TT(EFF)} = \frac{V_{IH(AC)} - V_{IL(AC)}}{I(V_{IH(AC)}) - I(V_{IL(AC)})}$$

2. Measured voltage (VM) at tested pin with no load.

$$\Delta VM = \left(\frac{2 \times VM}{V_{DDQ}} - 1 \right) \times 100 \%$$

Output DC Current Drive

Parameter	Symbol	Min	Max	Unit	Notes
Output Minimum Source DC Current	I _{OH}	-13.4	-	mA	1, 3, 4
Output Minimum Sink DC Current	I _{OL}	13.4	-	mA	2, 3, 4

Notes:

1. For I_{OH} (DC); V_{DDQ} = 1.7V, V_{OUT} = 1420mV. (V_{OUT} - V_{DDQ})/I_{OH} must be less than 21Ω for values of V_{OUT} between V_{DDQ} and V_{DDQ} - 280mV.
2. For I_{OL} (DC); V_{DDQ} = 1.7V, V_{OUT} = 280mV. V_{OUT}/I_{OL} must be less than 21Ω for values of V_{OUT} between 0V and 280mV.
3. The DC value of V_{REF} applied to the receiving device is set to V_{TT}.
4. The values of I_{OH} (DC) and I_{OL} (DC) are based on the conditions given in Notes 1 and 2. They are used to test device drive current capability to ensure V_{IH} min plus a noise margin and V_{IL} max minus a noise margin are delivered to an SSTL_18 receiver. The actual current values are derived by shifting the desired driver operating point along a 21Ω load line to define a convenient driver current for measurement.

OCD Default Output Characteristics
 ($V_{DD} = 1.8V \pm 0.1V$, $V_{SS} = 0V$, $T_A = 0$ to $+65^\circ C$)

Parameter	Symbol	Min	Nom	Max	Unit	Notes
Output Impedance		12.6	18	23.4	Ω	1, 2
Pull-up and Pull-down mismatch		0		4	Ω	1, 2, 3
Output Slew Rate	S_{OUT}	1.5		5	V/ns	1, 4, 5, 7
Output Step Size for Calibration		0		1.5	Ω	6

Notes:

1. Absolute specifications: $0^\circ C \leq T_{case} \leq +85^\circ C$; $V_{DDQ} = +1.8V \pm 0.1V$, $V_{DD} = +1.8V \pm 0.1V$.
2. Impedance measurement condition for output source DC current: $V_{DDQ} = 1.7V$; $V_{OUT} = 1420mV$; $(V_{OUT} - V_{DDQ})/I_{OH}$ must be less than 23.4Ω for values of V_{OUT} between V_{DDQ} and $V_{DDQ} - 280mV$. Impedance measurement condition for output sink DC current: $V_{DDQ} = 1.7V$; $V_{OUT} = 280mV$; V_{OUT}/I_{OL} must be less than 23.4Ω for values of V_{OUT} between $0V$ and $280mV$.
3. Mismatch is absolute value between pull-up and pull-down, both are measured at same temperature and voltage.
4. Output slew rate for falling and rising edges is measured between $V_{TT} - 250mV$ and $V_{TT} + 250mV$ for single ended signals. For differential signals output slew rate is measured between $DQS - DQS\# = -500mV$ and $DQS\# - DQS = +500mV$. Output slew rate is guaranteed by design, but is not necessarily tested on each device.
5. The absolute value of the slew rate as measured from V_{IL} (DC) max to V_{IH} (DC) min is equal to or greater than the slew rate as measured from V_{IL} (AC) max to V_{IH} (AC) min. This is guaranteed by design and characterization.
6. This represents the step size when the OCD is near 18Ω at nominal conditions across all process and represent only the DRAM uncertainty.
7. Timing skew due to DRAM output slew rate mis-match between $DQS/DQS\#$ and associated DQs is included in t_{DQSQ} and t_{QHS} specification.

Output Slew Rate Load Diagram

IDD Specification Parameters and Test Conditions

IDD Specification Parameters and Test Conditions (Contd.)
Notes:

1. IDD specifications are tested after the device is properly initialized.
2. Input slew rate is specified by AC Parametric Test Condition.
3. IDD parameters are specified with ODT disabled.
4. Data bus consists of DQ, DM, DQS, DQS#. IDD values must be met with all combinations of ERMS bits 10 and 11.
5. Definitions for IDD
 - LOW = $V_{in} \leq V_{IL(AC)}(\max)$
 - HIGH = $V_{in} \geq V_{IH(AC)}(\min)$
 - STABLE = inputs stable at a HIGH or LOW level
 - FLOATING = inputs at $V_{REF} = V_{DDQ}/2$
 - SWITCHING = inputs changing between HIGH and LOW every other clock cycle (once per two clocks) for address and control signals, and inputs between HIGH and LOW every other data transfer (once per clock) for DQ signals not including masks of strobes.

CKE minimum pulse width (high and low pulse width)	t _{CKE}	3	-	3	-	3	-	3	-	3	-	ps	2, 17

Notes:

1. The AC and DC input level specifications are as defined in the SSTL_18 standard (i.e., the receiver will effectively switch as a result of the signal crossing the AC input level and will remain in that state as long as the signal does not ring back above [below] the DC input LOW [HIGH] level.
2. Command/Address minimum input slew rate = 1.0V/ns and is referenced to the crosspoint of CK/CK#. t_{1S} timing is referenced to $V_{IH(AC)}$ for a rising signal and $V_{IL(AC)}$ for a falling signal. t_{1H} timing is referenced to $V_{IH(DC)}$ for a rising signal and $V_{IL(DC)}$ for a falling signal. Derating values for Command/Address input signal slew rates < 1.0V/ns are TBD.
3. Data minimum input slew rate = 1.0V/ns and is referenced to the crosspoint of DQS/DQS# if differential strobe feature is enabled. t_{DS} timing is referenced to $V_{IH(AC)}$ for a rising signal and $V_{IL(AC)}$ for a falling signal. t_{DH} timing is referenced to $V_{IH(DC)}$ for a rising signal and $V_{IL(DC)}$ for a falling signal. Derating values for Data input signal slew rates < 1.0V/ns are TBD.
4. t_{HZ} and t_{LZ} transitions occur in the same access time windows as valid data transitions. These parameters are not referenced to a specific voltage level, but specify when the device output is no longer driving (t_{HZ}) or begins driving (t_{LZ}).
5. This maximum value is derived from the reference test load. $t_{HZ(MAX)}$ will prevail over a $t_{DQSCK(MAX)} + t_{RPST(MAX)}$ condition.
6. $t_{LZ(MIN)}$ will prevail over a $t_{DQSCK(MIN)} + t_{RPRE(MAX)}$ condition.
7. The intent of the Don't Care state after completion of the postamble is the DQS driven signal should be high, low or high-Z and that any signal transition within the input switching region must follow valid input requirements. That is if DQS transitions high [above $V_{IHDC(MIN)}$] then it must not transition low (below V_{IHDC}) prior to $t_{DQSH(min)}$.
8. This is not a device limit. The device will operate with a negative value, but system performance could be degraded due to bus turnaround.
9. It is recommended that DQS be valid (HIGH or LOW) on or before the WRITE command. The case shown (DQS going from High-Z to logic LOW) applies when no WRITES were previously in progress on the bus. If a previous WRITE was in progress, DQS could be HIGH during his time depending on t_{DQSS} .
10. The refresh period is 64ms. This equates to an average refresh rate of 7.8125 μ s. However, an REFRESH comand must be asserted at least once every 70.3 μ s or $t_{RFC(MAX)}$; issuing more than eight REFRESH commands back to back at $t_{RFC(min)}$ is not allowed.
11. Each byte lane has a corresponding DQS.
12. CK and CK# input slew rate must be ≥ 1 V/ns (≥ 2 V/ns if measured differentially).
13. The data valid window is derived by achieving other specifications: t_{HP} , ($t_{CK}/2$), t_{DQSQ} , and t_{QH} ($t_{QH} = t_{HP} - t_{QHS}$). The data valid window derates in direct proportion to the clock duty cycle and a practical data valid window can be derived.
14. $MIN(t_{CL}, t_{CH})$ refers to the smaller of the actual clock low time and the actual clock high time as provided to the device (i.e. this value can be greater than the minimum specification limits for t_{CL} and t_{CH}).
15. $t_{HP(MIN)}$ is the lesser of t_{CL} minimum and t_{CH} minimum actually applied to the device CK and CK# inputs.
16. READs and WRITEs with no auto precharge are allowed to be issued before $t_{RAS(MIN)}$ is satisfied since t_{RAS} lockout feature is supported in DDR2 SDRAM.
17. V_{IL}/V_{IH} DDR2 overshoot/undershoot. Refer to 256MB, 512MB, or 1GB DDR2 SDRAM component data sheet for more detailed information.
18. $t_{DAL} = (n_{WR}) + (t_{RP}/t_{CK})$: For each of the terms above, if not already an integer, round to the next highest integer. t_{CK} refers to the application clock period; n_{WR} refers to the t_{WR} parameter stored in the MR[11,10,9].
19. This is a minimum requirement. Minimum READ to internal PRECHARGE timing is $AL + BL/2$ providing the t_{RTP} and $t_{RAS(MIN)}$ have been satisfied. The DDR2 SDRAM will automatically delay the internal PRECHARGE command until $t_{RAS(MIN)}$ has been satisfied.
20. Operating frequency is only allowed to change during self refresh mode or precharge power-down mode. Anytime the operating frequency is changed, not including jitter, the DLL is required to be reset followed by 200 clock cycles.
21. ODT turn-on time $t_{AON(MIN)}$ is when the device leaves high impedance and ODT resistance begins to turn-on. ODT turn-on time $t_{AON(MAX)}$ is when the resistance is fully on. Both are measured from t_{AOND} .
22. ODT turn-off time $t_{AOF(MIN)}$ is when the device starts to turn-off ODT resistance. ODT turn-off time $t_{AOF(MAX)}$ is when the bus is in high impedance. Both are measured from t_{AOFD} .
23. This parameter has a two clock minimum requirement at any t_{CK} .
24. t_{DELAY} is calculated from $t_{1S} + t_{CK} + t_{1H}$ so that CKE registration LOW is guaranteed prior to CK, CK# being removed in a system reset condition.
